# 1661. For your interest

Yahoo group: T-368_BC-610
Date: 2003-03-03 02:43:45 UTC
From: redmenaced <redmenaced@yahoo.com>
Topic: 1661  Message: 1661

This is the URL for the homepage for this list, there is a files section, a photo section, an archive section, and a chat feature.

Why we need a chat feature I have NO idea!

http://groups.yahoo.com/group/T-368_BC-610/

Three newbies today, that makes 166 people subscribed and three with bouncing messages,.... oh well,

Joe KG2CI

# 1664. MRCG 2003

Yahoo group: T-368_BC-610
Date: 2003-03-05 06:46:42 UTC
From: w7qho@aol.com
Topic: 1664  Message: 1664

All,

A reminder, the 2003 MRCG meeting will be held at Ft. MacArthur, San Pedro. CA on 2, 3 and 4 May. (Note: This is a change from previous announcements). Please mark your calendars.  Events will include exhibits and demonstrations of vintage military radio equipment, technical presentations and operating activities.  More detailed information will follow as the meeting date approaches.

For those who are thinking of attending this years Military
Radio Collectors Group meeting in Fort MacArthur, pictures
of previous meetings are available on the West Coast
Military Radio Collectors Group web site.

http://syzen.com/milradio/

It has always been great fun with an excellent swap meet,
presentations and lots of equipment exhibits. It is coming
up in May 2nd - 4th. Info of meeting is on the web site.
For more information contact Dennis DuVall, at w7qho@...

# 1666. New K51 owner to the group

Yahoo group: T-368_BC-610
Date: 2003-03-05 20:08:55 UTC
From: cckwx
Topic: 1666  Message: 1666

Hi:

My name is Stephen Keith from Pembroke NH.
I collect Historic Military Vehicles (HMV's)
A couple years ago, I picked up a Chevrolet
K51 Panel truck that housed the BC-610 trans.
I also have the trailer for the generator.

I will be restoring the truck one of these years,
(have many 'ladies in waiting' to be restored)

I have been slowly collecting the radio parts
for the rear such as the two receivers, main
insulator, etc.

At some point in time, I will have to spring
for the BC-610 of some flavor. I also suppose
I will have to make a decision at that time
depending upon the BC-610 (working or will never)
to get a license.

Steve AKA Dr Deuce

Hope to see Mr. Duce at the Weare, NH MV rally in July!!!!

Usually Dale, KW1I has an M38A1 on the northern perimeter of the field set up with a radio. Find us. I would love to see that K51 completely outfitted.

Tom

I go to the Weare Rally evey year. Last year I brought 10 pieces
of equipment:

CCKW deuce towing Searchlight Trailer with Clarkair dozer inside
Chev Bomb Truck towing Bomb Trailer
GPW Jeep towing 37mm AT gun
M151 Jeep towing Jeep Trailer

I was short one large vehicle to tow the Water Buffalo, so I had
to make an extra trip...

I use to work with Dale. He REALLY wants to see the K51
running with all the gear! Because I have a fleet of HMVs
I can wait for 'deals' on equipment/parts to outfit the various
vehicles and trailers.

The K51 came from Idaho and was purchased on E-bay a couple
years ago.

Steve AKA Dr Deuce

I never even knew about this event. I usually attend the antique boat
show at Weare's Beach in July, so this would be yet another opportunity
to get out and have some fun. When exactly is it? Will you be bringing
up a spare 300G with you, Tom? Sure, it's not green, but it's still
heavy enough to qualify.... (-:

See, I thought that was how it was spelled.....now I'll need to get my map out. I'm just over in VT a ways, so it won't be much of a drive regardless. I''m thinking it's down near Manchester somewhere...

Thanks for the link and info, Steve - the K51 is certainly a worthy project, even a dream project for many of the BC-610 crowd....

The Weare Rally site is just off of rte 114 in Weare NH.

There is a truck route , rte 77 that comes off of rte 114 on
the Manchester end. Right after turning onto that truck rte,
you will see The Center Woods School (AKA Taco Bell School)
on the right. The new entrance is just past the school on the right.

Dale Gagnon and Larry Damour (both hams) are at the show every
year. Larry us the rally chairman. We usually have about 150 HMVs
and a couple hams....

The K51 will have to go to the body shop which is rare for my restorations.
After buying it by pictures only in ID, I got it home and it is solid as a
rock. However, I determined that you cannot make a tactical truck
out of a long 1.5 ton panel truck. The body willnot take the twisting.
I have some large cracks in the body by the rear doors. My plan is to
remove all the body mounting bolts aft of the drivers seat and replace them
with long bolts with springs on them to allow the frame to move and flex
under
the panel body

# 1675. Mic inputs for T3

Yahoo group: T-368_BC-610
Date: 2003-03-09 15:56:04 UTC
From: Jerry Kincade
Topic: 1675  Message: 1675

The T3 is up and honking on CW, now trying to get some audio in/through it. If I'm reading the manual correctly the carbon mic input on J11 needs about 450 mV for 100% modulation, but the 600 ohm line input at the rear J12 connector only needs -34 dbm, or about 4.5 mV. I'd like to use my spare Heil GM-4 with this thing. Haven't checked the specs on it yet but it certainly ain't anywhere near 450 mV. What kind of mic/input setup are most guys using? J12 in the back (600 ohm line input) with a matching transformer, or what? Is anybody successfully using a Heil goldline mic with their T-3, and if so what input setup are you using? I also have several D-104's, which can crank out several millivolts no problem, but would rather use the Heil if I can. Last problem is locating a mating plug for J12, which might be a trick in itself.
Many thanks,
Jerry W5KP

> Many thanks,

If I've remembered the gender correctly, the connector number (or one of them anyway) for the right angle connector that mates with J12 is UW1220MBnn, where "nn" is the cable clamp size in 32's of an inch. I have a couple of UW1220MB21 left @ $12.50 plus shipping. UW1320MBnn would also work. Both are right-angle male 9-pin. Difference is in construction of the backshell and cable clamp. There is also a third one that will work (don't have nomenclature handy) but it has a solder gland back shell and is not too convenient to assemble, in part because it requires a special pin-spanner set to disassemble and assemble. Actually, you can assemble it fairly well without the spanner, but getting used ones apart without one is difficult to do without damaging the threaded retaining ring. The first two only require a common screwdriver (and soldering iron, of course).

The correct carbon microphone for the T-368 would be the M-29(*)/U. I have a few of these as well. Early ones have straight cords. M-29C/U has a coiled cord. All are terminated in the common U-77/U connector (have a few of these as well). M-29 looks just like M-52 (microphone that finally replaced the venerable T-17) except for connector.

# 1677. T3 mike inputs:

Yahoo group: T-368_BC-610
Date: 2003-03-09 22:07:19 UTC
From: yardleyite@aol.com
Topic: 1677 Message: 1677

What kind of mic/input setup are most guys using? J12 in the back (600 ohm line input) with a matching transformer, or what? Is anybody successfully using a Heil goldline mic with their T-3, and if so what input setup are you using? I also have several D-104's, which can crank out several millivolts no problem, but would rather use the Heil if I can. Last problem is locating a mating plug for J12, which might be a trick in itself. Many thanks, Jerry W5KP Jerry, I use two mike inputs on my T368-E. #1 - I wired up a crystal head amplified D104 to the existing stock mike connector (from the M-29U ? handheld mike) and removed the +13V from the stock female connector on the front panel (Very Important!). I then bypassed the speech clipper, and the very restrictive audio filters in the speech amp. If you bypass the audio filters remember that you have to remove all ground connections when doing so. The result was very nice non-restrictive audio which is pleasant to listen too. Not too much low end but enough to add a little bit of punch before hitting the pearl lines while modulating into a scope. Mid range presence is very good and well as the highs. Mod #2: I purchased a Behringer VX-2000 'Ultra Voice Pro' voice processor and Behringer B-1 condensor microphone. ( both are very reasonable - about $225 plus shipping). I used the balanced audio input from the VX-2000 and tied the hot lead to the grid of the last 6C4 in the speech amp. All other connections go to a suitable ground. With the VX-2000 properly adjusted the audio is definitely high fidelity and overall comparable with some broadcast transmitters. MUCHO low end and brilliance. Rolloffs between octaves are smooth and leave little to be desired. I attribute most of this to the B-1 condensor microphone. I don't know if you wanted to take it this far but it is possible to take it to the point where it will sound terific. Regarding the Heil mike (or whatever one you use), you'll be dissapointed if you don't bypass the restrictive audio filters. In doing mod #2 you'll already be bypassing everything so you don't have to cut the +13VDC line, bypass filters, etc. and still be able to use the carbonium microphonium for making military nets etc. I hope this helps. # 1679. RE: [T-368_BC-610] Mic inputs for T3

Yahoo group: T-368_BC-610
Date: 2003-03-10 13:31:00 UTC
From: Tom Mackie
Topic: 1675  Message: 1679

I lifted the carbon mike voltage and went into the front panel with an original connector. The speech amp has been mildly re-worked to bypass the clipper and filters while also opening up some of the coupling caps. I use a D104 with an amp to drive the speech amp. The amp in the 104 has been modified to present a high impedence load to the crystal element. Also, I control the level with the amp in the mic.
Originally there was a hum problem and it was traced to the 600 ohm input. Off the top of my head, I had to disable that section of the amp to eliminate the hum. W1NZR did not have the same problem so it may just have been something going on here..just a tip in case you run across that.
When I first made the changes, it worked well. However, the really big change was made when the final tank was re-worked to eliminate the excessive bypass caps. Once done, there were much better highs coming through.
I get good reports in this configuration. Its not full broadcast hi-fi but it seems pleasant for listeners.

I was listening to 80 this weekend and N3IBX was pounding into Rhode Island with his T3. It sounded wonderful and I am assuming he was running it with his VX2000 setup. WOW

My gut reaction on Heil mics is that they are restrictive. The ones I hear on SSB almost mimic the carbon mic sound. I have not run across anyone running one on AM yet.

Hope to hear your T3 soon

Motor freight rates aren't really that bad when you consider what it would
cost to drive out there and pick it up. What costs is the crating if you
have to pay a freight forwarder to do it.

Topic: 1685  Message: 1685

Re: long-distance shipping:

I know from having other heavy machinery hauled for/ to me from far away that sometimes if you and the seller have some flexibility on when something is shipped, and you can dig around or find a local connection in an industry that ships large/ heavy products (I live near a center of the granite quarrying and monument sculpting industry in VT), sometimes you can get a trucking company to bring a large/ heavy item back on their return trip or partial load at an economical price (relative to the size/ weight/ distance you're talking about). Of course as Bob WA5CAB indicates, crating and other protection of the item can be critical and still an undertaking / substantial cost.

If someone wants to buy and ship this or another T-3 and I can offer any insight as to how I've arranged shipping in the above manner, feel free to drop me an e-mail off the list.

Trevor & Group,

I won't name any names (they may respond to a specific broadcast request for help, though) but there are two or three collectors, mostly retired and having fun buying, fixing and selling old heavy gear, who make trips around the country picking up or dropping off equipment. One of them has hauled several things for me. - most of an SCR-499 including the BC-610-E and PE-95-G to PA, several Teletype machines to AL, etc. You may have to wait until they are going in the right direction, which as a practical matter may mean that the seller will have to hold the item(s) for a while.

I know from having other heavy machinery hauled for/ to me from far away that sometimes if you and the seller have some flexibility on when something is shipped, and you can dig around or find a local connection in an industry that ships large/ heavy products (I live near a center of the granite quarrying and monument sculpting industry in VT), sometimes you can get a trucking company to bring a large/ heavy item back on their return trip or partial load at an economical price (relative to the size/ weight/ distance you're talking about). Surprised me, too!

The line under the winning bidder area of that page
says, "The seller ended this listing early to sell to
the high bidder at current bid price".

Now, what does that mean? And why would he do that?

Bruce/N9KGR is looking for a modulation (T9) and driver (T8) transformers for one of his BC-610's,for the F, H, or I models.

Please contact him directly. He does not have an Internet connection.
His phone is (920)693-3247. Call 4-9PM CST weekdays or days on the weekends. Any help would be very much appreciated.
If propagation is good,listen for him on 3885 or on the Midwest Classic Traders net Saturdays@8AM CST run by Rob/WA9ZTY.

Thanks,

Mike

# 1697. T-3 Question

Yahoo group: T-368_BC-610
Date: 2003-03-18 01:00:55 UTC
From: Jerry Kincade
Topic: 1697  Message: 1697

Re the T-368C: Under normal operating conditions, approximately what audio driving voltage do the 4-125 modulator grids require (using a 1000 hz single-tone input) in order to achieve 100% modulation? This rig has a full carrier and clean sound, but can't get more than about 50% modulation out of it. I'd like to verify the speech amp and it's output transformer is putting out the required drive to the modulator tubes, as soon as I can figure out what that voltage should be.

Thanks,
Jerry W5KP

Jerry,

Never measured it, but the bias on the grids of the 4-125s runs around -160 volts +/- a bit depending on the setting of the bias control on the front panel. Since the modulator tubes are running AB1 the grids shouldn't be driven positive (the 6C4 driver won't do this anyway), and since the the audio system has just enough punch to modulate the rig fully, the maximum peak-to-peak voltage swing at either 4-125 grid should come out to around 320 volts. i.e., +/- 160 volts around the -160 V. bias point.

From: w7qho@aol.com
Topic: 1705  Message: 1705

All,

I recently picked up a WW2 T-30 throat microphone at a fleamarket. Hooked it up to my ART-13 and made a few tests with my friends here in Southern California. The universal report was very muffled, restricted and only marginally intelligible audio, the same results I remember from the last time I played with a throat mic back in the 50s. The unit was in very good condition, BTW, and had very high output -- modulated the ART-13 fully.

My question here is, was there a particular communication technique, method of articulation, special vocabulary, etc., which had to be used with these things? Hard to believe they were satisfactory for operational use. Has anyone had personal experience here?

I just picked up a PE-95 genset to go with my Cheverolet K51 panel truck
and 1 ton trailer that I am slowly buying radios etc to make up the SCR 299
that originally went inside it

The gen is the type 2 according to the manual and is the larger 10kw model.

I got the PE-95 to run today...!!!!!!!!!!!!!!!

It took a little work, but is seems to run an make AC.
I don't understand how they use the DC exciter as a
direct drive starter for the engine. It is not that large
and if you look at the normal reduction on a starter
motor, it is quite large.

Anyways, someone installed a regular starter motor
and that is what I used to start it. I will try the normal
starting means this week.

From: Trevor Lewis
Topic: 1708  Message: 1710

The later, higher output PE-95s did use a separate starter motor like you describe, rather than making use of the generator's DC exciter for double-duty as a starter motor. Be sure to get the manual, including the separate supplement for the later models like you have, so that you don't accidentally try to retro-engineer your PE-95 to be something other than it originally was. The double use of the exciter as a starter motor in the early PE-95s was ingenious, but using the separate starter on the later units was probably simpler and perhaps more reliable.

I have copies of the PE-95 manuals, including the supplement for the later units, or you can probably get them, like I got mine, from Robert Downs, WA5CAB, who is on this list, and who supplies superb reproduction (or when available, original) G.I. Tech Manuals.

Now we need to get you to get your ham ticket and the BC-610 to make your situation complete :-)!

73 (ham shorthand for best regards)

From: wa5cab@cs.com
Topic: 1711  Message: 1711

Check the nameplate (unless some @#$% beaurocrat removed it). It should ID the model. The A, B, C and F are rated 5KW (the first three @ 112.5V and the latter @ 120V). The G, H, I and K are rated 10KW, the first two @ 117V and the last two @ 118V. The do not appear to have ever been any D, E or J. Orders may have been placed, which took the nomenclature rev, and then canceled. The TM is TM 11-904 dated 7 July 1945 which covers up through PE-95-H, and Change 1 dated 19 February 1953 covering the I and K.

I sold my SCR-499 with PE-95-G last year and never actually ran or worked on the generator but according to the TM and C1, the PE-95-F had a conventional 6 Volt starter motor and all of the other models used Exciter starting. The photos of the G and H in the TM and the I and K in the Change show no external starter motor or DC generator. There is a port on the right side of the flywheel housing which in the photo is covered by a blanking plate. There is nothing unusual about using the DC exciter (generator) as the starter on up through medium power separately excited AC generators. Most people alive today weren't yet born when alternators replaced generators on automobiles and trucks and have seldom if ever encountered DC generators. But one of the important differences between a DC generator and a DC motor is simply what you intend to do with it. One quick and dirty way to test a automotive or aircraft shunt wound DC generator is to connect the field winding across the armature and apply the rated 6, 12 or 24 volts. If it does not start and run as a motor, there's something wrong with it (not that it is a very efficient motor, mind you).

So my guess is that either yours is an F or someone added the starter motor.

Steve,

OK. But I might better explain that nowhere other than in the TM 11-904 that you apparently have will you see the generators referred to as Model (2), Model (1), etc. That was a convention used by the TM writers of several late war TM's where the earlier TM's (in some cases multiple ones on several individual models) were beeing revised to cover several letter suffix models. Best (worst?) example that I know of is TM 11-300 on the SCR-211 (BC-221). It covers 26 models in one volume.

Anyway, the basic engine in the PE-95 is a de-rated Willys MB engine. Most of the internal parts are the same. The difference is mostly external. I don't know all the details but I'm sure that Brent Mullins can help should you ever need any basic engine parts.

But the starter on yours is of course not from the MB, which had a 6 volt electrical system. Just out of curiosity, where did whoever modified it put the starter switch? And I wonder why they bothered? It would have been simpler and cheaper to do what they did on the I and K, which was to provide a connection point for an external auxiliary battery for starting under severe conditions. My guess, from having encountered similar circumstances in the past, is that when you check out the original starting circuit you are going to find some component bad or even just disconnected. And rather than fix it properly, they jury-rigged it.

OK, so what manual is the one I need? Mine is the TM11-904 July 45 version for versions A-C, F-H

The starter is of unknown voltage due to the label being missing. Not having enough detail in the manual, I cannot tell what and where the starter relay was or looked like. It presently has a Ford car type relay. The unit also has a non-original electric fuel pump.

All my Historic Military Vehicles (HMVs) [and I have a lot] are 12v with alternators and electric fuel pumps. Having driven my primary HMV over 50,000 miles, I want reliability foremost, so this genset being so converted is not an issue for me. Its job is to look original and make AC. Its most important function is to start w/o question every time and run reliably.

BTW: My GPW has a 6v starter that runs on 12 v like all the other HMVs. On the GM starters, there was a different pinion gear between the 6 and 12v versions so they could easily be ID'ed

But the starter on yours is of course not from the MB, which had a 6 volt electrical system. Just out of curiosity, where did whoever modified it put the starter switch? And I

wonder why they bothered? It would have been simpler and cheaper to do what they did on the I and K, which was to provide a connection point for an external auxiliary battery for starting under severe conditions. My guess, from having encountered similar circumstances in the past, is that when you check out the original starting circuit you are going to find some component bad or even just disconnected. And rather than fix it properly, they jury-rigged it.

I have gotten the genset running really well. It smoked for quite a while but has completely stopped!

On an almost disasterous note: While starting it with the aid of the starter/charger, the connection became loose from the charger and as I bent over to stop it from sparking, the battery exploded with my face about 16" away! The whole top of the battery was ripped off! It was an industrial battery bigger than a group 27 My hand was cut and my face/head covered in full recharged battery acid! Luckly my Step-son was there working on his car and took me back to the house keeping my eyes closed. I flushed my head and face with the shower sprayer and everything is OK. Luckly I had kept my glasses on. I take them off a lot of time for really close up work....

It was a nice battery and I will miss it...

Luck to be seeing you all
Steve

Greetings,

Well my next radio room is going to be in a
upstairs loft and the BC-610G has got to go. It's in
working order and comes with the BC-614-D
Hallicrafters speech amp. This speech amp is nice
because it has a switch that does the PTT. The only
thing you need is a antenna relay and new power cable
and it's ready. It has a rock in it for 3885 and
comes with various tuning units and coils/manuals.
Asking $550 OBO. Pick up in Jacksonville, Al. 36265.
If interested I can send some photos of the radio and
speech amp. Thanks! Bill PS...will throw in the
D-104 too....plus the dolly thing I made for the radio
so it can roll.

Until I sold the last extra one that I had, I was getting about $12.50.
Maybe I should add it to my list of reprint offerings. :-)

From: w7qho@aol.com
Topic: 1664 Message: 1728

MRCG - EIGHTH ANNUAL MEET

The eighth annual meeting of the Military Radio Collectors Group (MRCG) will be hosted by the Fort MacArthur Military Museum, San Pedro, CA, on Friday, Saturday and Sunday, May 2, 3 and 4, 2003. San Pedro is located on the south side of Los Angeles adjacent to the Harbor. The Museum will be monitoring 51.0 MHz and 146.52 MHz (call W7QHO/6) to assist arriving participants. This year's event will formally begin at 0800 Friday morning when the gates to the park open, and early arrivals are welcome Thursday afternoon as in previous years.

Friday and Saturday will be devoted to equipment setup and display, operating events, and informal get-togethers on the Museum grounds. Secured areas for equipment operation and display will be available within the Fort's complex of bunkers and underground corridors and there is ample room on the museum grounds to accommodate out of doors activities. Participants are encouraged to bring equipment and set up working displays and demonstrations. Special activities will include heliograph and signal light demonstrations and six meter fox hunts. Several technical sessions and lectures will also be scheduled over this period including presentations on Soviet and British radio equipment and our own ART-13 among other topics.

The equipment judging program introduced in previous years will l be managed by Rian Robison, W6SVU (562-421-7213).

Equipment and parts swapping activities are encouraged throughout the meet and, in addition, Sunday morning 0600 - 1000 has been cleared specifically for this purpose. The meet will officially end at the conclusion of this activity.

There are no admission charges for this event, but a "fair share" c ontribution of $5.00 is requested from each participant. Funds remaining after all expenses are met will be donated to the Fort MacArthur Museum Association.

For detailed information including lodging, food and driving instructions go to the MRCG web site: http://www.syzen.com/milradio/

Greetings to all,

BC-939 antenna tuner for BC-610 or T-368. This one is blue-gray to match to T-368. Unit is complete with vacuum capacitors, dirty, paint is faded. Should clean up fairly easily. $175.00 plus professional packing, shipping,
and insurance from Houston. Will deliver to Dayton for 50% before departure.
All the T-368's are gone but still have some parts. Pictures are available.

My apologies for posting this to a bunch of places, but I think it's worth busting a rule or two.

If you are in need of "Military Style" connectors, try:

William Perry Co.
702 Beechwood Road
Louisville, KY 40207
502-893-8724

I needed a bunch of connectors for a Harris amp & Mr. Perry had them all at very reasonable $$.

But be prepared for a SURPRISE. They insisted on sending the connectors to make sure they were correct BEFORE I paid for them. And, they only want your personal check or an MO when they finally get around to taking your $$ (no plastic).

I'm not sure what range of products they have and they have no internet site or email. I have no interest in the company other than being a very satisfied and pleasantly surprised customer.

Best 73, Bill

I've met Bill Perry at the Rochester, NY Hamfest
TWICE!

He is a top notch guy always willing to help in any
way he can, and he usually can, he's very
knowledgeable about connectors.

Good prices, big supply.

All,

Vintage Field Day sponsored by ER magazine will be held on Saturday, June 7 this year. Let's all pitch in to make this a memorable event. If you are unable to set up out in the field yourself, please try to get on the air during the day from home, especially on 20, 15 and 10M. Past events have been great fun, but it's been pretty lonesome out in the weeds from midmorning through the afternoon. Again, let's make this time around one to remember.

Hmm,..... that's a long waiting list you're on.

Not many turn up in that area either, be aware
shipping one is tough and can be expensive.

You might be so bold as to find one in Idaho or even
Montana. A mod deck for one did turn up recently in
Wyoming, free for pick up. My suspicions are that
they'd be more common in California, W7QHO may be more
help there.

They come rarely on E-bay, they seem to have dug
individual holes and disappeared in the last few
years. I saw several waiting for the crusher at
Seneca Army Depot in the early '90's.

Bill,

Try copying the ten-digit Item number and pasting it into the first search field that comes up on the eBay home page. It's a T-368 PTO and buffer section.

I notice that the seller has some pretty draconian payment and "who can even bid" requirements. But check the slack he cuts himself on how quickly he might ship. Feedback figures aren't exactly sterling, either. :-) Unit looks pretty decent, although not without scratches.

Here are a couple of items that just came to my attention on ebay.
This fellow will be putting up the BC-610H w/all coils, mo units and
speech amp. Also has the 833A Linear Amp that the 610 drove. The owner
of the equipment is retired from Ham radio, he is in his 90's, and has
enlisted Casey's help, who is putting together that ebay listing.
Casey's email is: precisefreelance@... His phone number is listed
on the mo tuner page on ebay.
I finally found the ebay site on the 368 VFO.
Cheers and have Phun

Bill,

Try copying the ten-digit Item number and pasting it into the first
search
field that comes up on the eBay home page. It's a T-368 PTO and buffer
section.

I saw the mentioned stuff on ebay. That 939 is nice but there sure were some funny cartoons about fueling the PE95 in the 'near field'. Does anyone have a rebuildable junction box that went between the 610 and 614? Does not need to be pretty, just not totally rotten. Just shipped out my last two 614s but have other bits for the trade blanket.

Just to let the group know , I bought a T-368 transmitter and picked it up today.
I had originally sold this transmitter last year and was able to buy it back from the gentleman and friend ,Glen G.,that I sold it too.

I wish to thank Joe and the other kind members of this group that responded to my post.

You are all a great bunch of guys!!

Kind Regards to all,
73's

Hi Joe,

I believe the 6000 tube didn't crap out after all. I put a replacement in and my problem disappeared. About 10 minutes later it was back. Put the old tube in and it's worked.

I have an audible "wining" noise that occurs when keying the mike. Sometimes when you drop the carrier and key again it disappears. It doesn't appear to affect the output and is not audible in the modulated carrier. Listening from the outside of the T-3 puts it in the vicinity of the PTO / Int Amp. It occurs now more often than not. Usually, keying the plate relay first, will prevent this wining from occurring. The other day I lost Int Amp Plate current. The replacement tube put things back to normal and the wining quit. Then 10 minutes later wining came back. I then put the old tube back in and the Int Amp Current was still there, and so was the wining.

N3IBX has told me he has had the same wining problem and thinks it was ultrasonics. He tightned screws and connections and his went away. No luck on my end yet. I've tried quite a few things. I'll track it down eventually.

73, Dave.

Why don't you just change those bulkhead connectors to "N"?

If you insist, I have used "C" connectors for RG-8/11 size cable.
E-Mail me a check and I'll fax one over to you.

Tom

No, I don't have it, the E-mail is in the ad below.

I didn't go to this hamfest either, this is someone else's post from another list.

Joe

While cruising around at the Mdfma fester today I ran into a guy with a complete set of fairly bc610 coils.
After talking for a while he said it was his second set and he wasnt using the transmitter. He said that he didnt know what he was going to do with it and could probably be talked into selling it. I have no real interest in it, but I figured someone out there would. I dont know the guy, so i cant vouch for the condx of the rig or anything else about it or him, but I'm sure one of you may want to contact him. His email was --aa3nm@... (delete the dashes) He lives in the Gaithersburg Md. area.

From: Walter Wilson
Topic: 1768  Message: 1768

I have a B&W CU-45 antenna tuner for sale. On the outside, it looks a lot like the BC-939. I understand this version was designed primarly to tune mobile whips, although a previous owner used it on 160 meters with a random wire.

Asking $140 plus shipping before this one goes to eBay. Will post pictures here:

While we're advertising stuff for sale on E-bay, here is a TS-505 that is probably the best looking one I've seen on there, but looks don't mean much.

This IS, however, the early TS-505 "A" model which was built by Phaostron, the original contractor, in 1952, they were slightly more accurate than the later models.

It doesn't have the retro-fit bezel that allowed zeroing the meter needle.

All,

I queried the seller on this. He's a ham, BTW, and replied that he was driving the PA with an external rig on 20, 15 and 10M. I knew the T-3s would work on 15, but surprised the Pi-L output tank would resonate as high as 28 mHz. Anyone on the list ever try this?

From: n7oo@theriver.com
Topic: 1781  Message: 1782

Jerry most of the prices I see today seem high to me, but then too, the availability of complete clean operational BC-610 (systems) are pretty scarce. I'n not sure that not having a back panel is a big minus as it's fairly common to leave these off for ventilation purposes. "Roughness" is another matter. I acquired my 610E in rough condition and it's a non-trivial task to re-wrinkle and silk screen the panels.
My opinion that 1 grand for a rough '610/614 less antenna tuner and minus a complete supporting frequency compliment is on the high side.

Jerry ,you wanted a quote for a set on tunners and coils for 160,80,40 and 20 and that was what I quoted...The 160 set in $200 alone..I included the 80,40,and 20 in the grand...Your choice if two I models Both still work and the 614..+ cables...( homenmade)...Try to find a mic connector for a 614...I can part these out for more, but its nice not packing and shipping even at someone elses expense...
Larry said:
>>>Ok help me put this together. I want one BC-610, One bc-614 a back for the rig and coils for 160-80-40-20 and a suitable tuner for the bc-610... if you have it all price it as a package. Or price all you have and list what is in the package and price total.>>

IF I qouted without the set of tuners and coils for each band I did not mean to..
Anyway, Your pick at belton...One B-610 (your choice), 1 ea 614, Each band 160 80 40 20 coils and tuners..The 160 plate coil is a varible link and is in new condition...Try to find one of those.. and one back that needs refinished...$1000
Anyone else with In put as to why this is high I'd like your Input...

Had a friend that sold an unopened BC-610 in tha crate but Buyer took it "as opened"....Asked and got $2500 + delivery...You can do alot of painting for $1500..Larry worst that can happen is you don't like what you see and pass it up..I was going to belton anyway .Let me know....Thanks..

# 1788. BC-610E meters - A request for information

Yahoo group: T-368_BC-610
Date: 2003-07-03 13:53:03 UTC
From: Jorge Gomes
Topic: 1788  Message: 1788

Greetings to the list,

I would very much appreciate having your comments on the number and type of the possible cosmetic variations that can be found on the meters of the BC-610E.

Any indication of their correlation to manufacturing series or other significant details will be greatly appreciated.

Thanks in advance and very best regards from sunny Portugal,

Jorge

Home Depot has an excellent selection of casters. Get the really
heavy duty ones. They are about $15 each. You can bolt them on
or weld them on as I just did.

Hi Guys,
a quick question and comment. Question: are you using the mount for
mobile
operation of the T-368? If so it takes more space and can be removed
quite
easily. Comment once the base plate is removed the T-368 sits nicely on
a
furniture mover from Home Depot or Harbor Freight at 14.99 for the whole
thing with 4 casters rated for 700 pounds and once the T-3 is on it it
moves
very easily with swivel casters on all four corners! Just a heads up and
FYI.

I suppose "mobile" is a relative term, but in any case I'd recommend extending the fore-and-aft "footprint" of the base a few inches. If you get the modulator drawer or even the RF drawer extended partway and begin jacking around with it (which you will have to do), and the unit is mounted on casters that are too close together underneath, a very serious situation can quickly develop. These were much nicer to deal with on the ship, where they were bolted down to a steel deck. On my Crosley I mounted a couple of HEAVY aluminum 2x4 rectangular tubing rails underneath each side, extending them both out 4" from the base. Heavy duty 4" casters (with brakes) were then mounted to the underside of the rails near their ends. The result was a very easy to roll around and very stable setup.

I still haven't figured out an easy and safe procedure to remove and replace the modulator drawer without help, though. I've done it alone a couple of times, and both times kind of scared myself using the old 2x8 prop method. I'd be interested in hearing how you brutes out there do it. I've never actually weighed it, but the mod drawer for sure outweighs me (I'm 6'-3", 220 lb), and it's nowhere near as heavy as the power supply drawer, which thank God is on the bottom (gee, I wonder why). The only saving grace is if I drop the PS drawer, it doesn't have far to fall!

73, Jerry W5KP

ALL,

At the moment I don't have permission to put out the whom and where.

HOWEVER, I was asked if I knew of anyone wanting one. I do NOT know which model, nor condition, nor what all components are with it. I will post ALL information as soon as I receive it, and permission to publish the WHOM and the WHERE.

# 1800. T-3 Air Exhaust cover?

Yahoo group: T-368_BC-610
Date: 2003-07-23 21:05:04 UTC
From: K3PID
Topic: 1800  Message: 1800

I am trying to repaint etc. my T-3 but I can't find any info on the cover/deflector/filter whatever that was originally installed over the exhaust vent. ( top, left of rear panel). Does anyone have some pictures or even drawings that show the details of this area? My scanned copies of the manuals have such poor quality images that I can't tell what was there.

Tnx
K3PID - Ron H.

PS: Now that I am the very proud owner of a T-3, how/where do I get my info into the registry???

Ron,

The vent opening in my "Basic" model is covered by a brass screen, with about the same mesh size as would be found on a standard screen door. Held in place by a brass frame plate on the inner surface cut out to match the opening in the back panel. Neither the frame plate nor the screen are painted on my rig.

++++++++++
Yup, 'bout the same on my "E", maybe "F" model.

NOw the duct on the intake side is something to
behold! It wraps around the left side of the cabinet
and has a big brass filter in it.

Joe

# 1805. T-368 Registry

Yahoo group: T-368_BC-610
Date: 2003-07-25 13:27:37 UTC
From: billn2bc
Topic: 616  Message: 1805

Hi Joe, you woke me up! ;-)

I haven't sent out the registry because it always online! Go to the
T-3 page in YAHOO,

here: http://groups.yahoo.com/group/T-368_BC-610/

Then in the left panel, use the link for DATABASE. I guess I
should periodically post a pointer.

Anywho, check it out. Registry updates to me, direct email or posted
here will be fine. I'll be sure to put out a notice when an update
happens.

73, Bill

# 1806. FS: BC-610F in E. Texas

Yahoo group: T-368_BC-610
Date: 2003-07-25 18:33:28 UTC
From: billn2bc
Topic: 1806  Message: 1806

Posting for W5JGI, inquiries to Jim Hyde, W5JGI, jhyde@...

~~~~~~~~~~~~~~~~~~~~~~

BC-610F; has been used on the air by a ham. It has external drive jack, ant. changeover relay, 13 assorted coils, 13 assorted tuning units, BC-614 with connecting cable, original manual, AND is on casters. The cabinet is excellent, although the top cover could use refinishing (as usual). The interior is pristine - beautiful. It looks to me like a "plug-and-play", though the power cord is missing. I have many pictures that I will gladly email to interested parties. NOTE: I have an F model just like this one on the air, and it has worked beautifully on 160 thru 15 mtrs., both on AM and as SSB amp. for many years. This one has everything needed except a 15 mtr. coil, (which I made for mine) to do the same thing. The price is $1500., though a somewhat lower offer might be accepted. Location is E. Texas.

Jim Hyde, W5JGI, Many,La., <jhyde@...>

+++++
I wonder if we could get a posting of the BC-610
registry, too? Maybe even the HT-4 registry, small as
it is.

# 1809. T-946/GRC-129

Yahoo group: T-368_BC-610
Date: 2003-07-28 17:01:33 UTC
From: Ken Warren
Topic: 1809  Message: 1809

I noticed in Sundays paper a T946/GRC-129 for sale in the Portland area. For those that are not familiar with this, it is the SSB version of a T-368. I don't know if it is still available but I will obtain the phone number if anyone is interested. Keep in mind that the T-946 is pretty much a linear amp with all of the am stuff removed. It requires external excitation and I do not know if the rest of the external gear is available or not.

Ken Warren K7RPX

# 1810. T-3 Air Exhaust ...MORE INFO

Yahoo group: T-368_BC-610
Date: 2003-07-28 20:39:18 UTC
From: K3PID
Topic: 1810  Message: 1810

Well I am pretty much convinced that the "shadow" that I see is from something that someone added to deflect the air. I took a couple of pictures to let the group decide for sure but now I can't seem to see alt.binaries.pictures.radio ! I go to the group but there isn't anything there!!! I even tried to post a test message (Hello! Anyone there) but it didn't show up. Might be something Comcast did! Maybe the thought those sexy old Zeniths were out of scope...Hi Hi.
Anyway, back to the subject, I'll send a picture to those who responded directly to see if everyone concurs!

Tnx
K3PID Ron H.

# 1815. BC 610C, or BC 610D

Yahoo group: T-368_BC-610
Date: 2003-08-01 12:40:08 UTC
From: Joe Munson
Topic: 1815  Message: 1815

Group,

I have a friend in the Ceder Rapids, Iowa area who has a BC 610 C or D model transmitter for sale, CHEEP! It is the model that looks like a HT4 from the Pix I have of it. He knows little about it. It has all the iron, but seems to be missing the top cover, the tubes, the Plug In coils and the tuning units. Has some rust on the bottom, but looks to be restorable to me. At least would be a good source of parts, but would rather see some one get it looking to restore it. He knows he could sell it on EPAY or part it out, but again, would rather see some one get it to restore it. If any one is instersted in the above, let me know off line. I can send the pix I have and put you in touch with him. He does not want to ship, so will have to be a pick up.

Roy,

That works, thanks for the tip! Unfortunately Yahoo want's you to sign-in
and the last time I checked, they wanted personal info that I didn't
wish to disclose. As a result, the registry is unavailable to non-Yahoo
members, sigh...

Rant: At one time I enjoyed 'shopping' the Yahoo auctions. However they
knocked a lot of people out when they refused to let anyone even review
the auctions unless they posted a credit card number up front! I never
did understand the purpose of this policy as it denies participation by
those who are too paranoid (such as myself) to risk this information
falling into the wrong hands. It also denies those who prefer to pay
by other means.

Please correct me if I'm wrong.

# 1820. T-3 (M3) Meter question

Yahoo group: T-368_BC-610
Date: 2003-08-04 00:48:20 UTC
From: K3PID
Topic: 1820  Message: 1820

The plate current meter (M3) appears differently in various published pictures. In some, the meter movement seems to be set back about an inch or so from the front bezel while other pictures show all three meters the same with the movement right behind the glass. Is this a model difference (basic vs lettered etc) or is something else going on? What would be the benefit of an inch of space in front of the movement?

K3PID - Ron H.

Unless the transmitter has been modified there is B+
voltage on that meter and it should be insulated from
the cabinet, this is one of the first things one
should check when starting an unknown unit for safety
related problems, the next is that the interlocks work
properly.

From: James M. Walker
Topic: 1820  Message: 1824

Ah Well,
Actually the meter movements are rated for up to 3KV usually, of course
that assumes NO ONE has opened the meter (of the sealed type) and
tinkered
with its innards. As for the recessed meter glass, A correct meter has
no
meter zero adjust screw, and the front plate was there to maintain the
"look" of the panel, there is a wooden spacer between the cover and the
actual meter, and you will notice at close inspection the mounting
screws
for the front are in different position from the screws in the
meter(rear)
so there is NO metal contact with the meter bezel outside the case.
Prevents electrical shock to the operator, and also places the meter
above
chassis ground, in case it does develop a case short. If you don't have
the glass on your meter, and there is an adjustment screw on its' face
it
is the wrong (and dangerous) meter. Caution caution 2400VDC may be
there.

From: K3PID
Topic: 1827  Message: 1827

Would anyone happen to have the support frame for the T-368 transmitter that they would be willing to part with? Look on page 6 of the operators manual TM-11-809-10 and you can see what I am looking for. It's the frame at the base of the cabinet that sticks out in front to stabilize the unit when one the drawers is pulled out. If all else fails, I'd settle for a drawing/sketch with enough detail to allow me to fab one.

Tnx & 73

Topic: 1827  Message: 1830

Ah,
The referenced manual, does not have a picture on page 6. However I think what you are looking for is the "Mobile Mounting Plate", referred to as Mount, Shock. The mount bottom was flat where the feet stick out, front and rear,
however it was found that if the bolts to the floor weren't in the unit would
flip over, bending the tabs, and quit possibly injuring the operator. They were
changed to the inverted "U" channel for the mounting tabs, eliminating this hazard. Most folk throw them away as they take up more room than available in some shacks. A neater arrangement is to put four swivel casters on the bottom of the unit cabinet for moving it. As for tipping over, well with the power supply in and locked down that "shouldn't" happen, however remember Murphy's Law.

Furniture movers (available at Harbor freight & Home Depot) for appx 15.00 are good for that and handle 700 pounds.

You also might check with Russ WB3FAU to see if he still has his around. The plate that is.

Someone suggested putting the ebay URL inside of right and left <> arrows,
it would unfold OK when the line splits.

e.g.
<http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=3038970360&category=4675>

Thanks for the heads up on this unit. Looks pretty weary tho.

Pretty good price, even without a full set of coils and tuning units. Has the rear cover which for some reason is often AWOL.

Which reminds me, I have a parts -F model already partially stripped if anyone is looking for pieces.

Well at first glance the 610 appeared to be pretty sharp looking and
with the uncluded tubes at the bid I first saw of $205 it looked like a
good deal. But...if you pulled the pictures into a file and magnified
them, one can see obvious signs of rust and corrosion as well as the
crummy looking wiring. If the winning bidder has to ship the BC-610
for any distance, suspect he's going to be very disappointed!

...and a little guy inside who checks voltages, changes out weak/bad tubes, and keps the blower lubed.

How about a nice little female Tuning Aid for loading the final? You tell her where you want it, she makes the necessary adjustments...

Guess my response yesterday only made it to Ron, but this transmitter was listed a couple weeks back on the AM Window BBS. The users there laughed him off the site, but he made it clear that there was no extra zero on the end. Probably why he still has it - considering epay prices are usually the market high, $1- $1.5K would be about all he could expect.

My feeling is this: the true measure of value should be taken not from what you get for it, but what you get from it (as in - use and enjoyment). Probably why there are so many disappointed "investors" out there holding overpriced radio gear.

While preparing for a big move, I came across 3 Frederics Electronics HF 1554 exciters with the tags on them as they came back from factory overhaul. They are 110VAC powered 1-1/2" tall 19"rack mounts. If I recall correctly , they have an output of 1/4W cw inthe 2-3 mhz range. This can be changed by internal strapping to accommodate various freq multlier schemes. Before I throw them on E-Bay, is any one in the group interested?

# 1850. 1554 exciter

Yahoo group: T-368_BC-610
Date: 2003-08-24 05:24:44 UTC
From: Ray
Topic: 1850  Message: 1850

Clearly a little more research is in order. My recollection of these units is that the "band divide ratios" were programmable with internal strapping to accommodate different multiplier schemes in various HF marine 250-1000W transmitters. A look at the PC board appears to bare this out. If I can get some time I will power one up and take some measurments. These devices definitely had a much bigger range in each band than the manual excerpt would indicate. I believe they tuned a 1 mhz range in each band.

# 1851. Companion Receiver for T3

Yahoo group: T-368_BC-610
Date: 2003-08-24 14:05:10 UTC
From: Ray
Topic: 1851  Message: 1851

While I was wondering what to do with he exciters I posted about, I came across a receiver I had forgoten I had, a USN FRR-22 which I used to use for BCB DX. These were RCA's attempt to compete with the R388 and R 390 series receivers. The freq display is projected onto the front panel. They were much faster to tune than the 388-390 receivers but as selective and nearly as acurate. These were seemingly the peak of development for a tube type tunable first oscillator receiver. The one I have is probably the rarest one of the series and covers 250KC to 8 MHZ.
Basically these are a super sharp looking receivers that would be a great partner for a T3 for 160-80/75-40 M AM &CW The SRR 11 + 13 VLF and 2-32 mcs respectively are fairly common on e=bay but I have never seen the SRR12 or FRR22 listed any where , ever.
Also in the pack of things is an SRR-11 and an R-220 if any one is interested....

# 1854. Serial Number Question

Yahoo group: T-368_BC-610
Date: 2003-08-25 20:25:49 UTC
From: K3PID
Topic: 1854  Message: 1854

My T-3 doesn't have a serial number. It appears to be mostly an A with some B - C parts possible. If I were to assign it a serial number, how would I go about trying to establish a "reasonable" serial number to use? How would I determine if the serial number was unique? Any suggestions? Maybe I should just not worry about such things?

K3PID Ron H.

# 1856. T-368 Manuals

Yahoo group: T-368_BC-610
Date: 2003-08-27 23:30:47 UTC
From: ab3l1@aol.com
Topic: 1856  Message: 1856

Hello, finally completed the transaction to get the T-3 here. One snafu of the deal was the manuals I didn't get. They were included in the price but the former owner can't locate them after about five months.
Question is, what is the present day value of an original operators and field service manual set? Is it still possible to get them?

Thanks,

Bob AB3L

Hi Bob,
The full set of manuals is available free if you have a printer at
http://eshop1.chem.buffalo.edu/T-368.html

If you don't have a high speed connection or a printer let me know, and
send along
your mailing address I will print all three double sided and ship them
out to you.
No sections, no one sided slanted printing just the manuals and no
charge.

# 1862. Manuals

Yahoo group: T-368_BC-610
Date: 2003-08-28 19:23:45 UTC
From: ab3l1@aol.com
Topic: 1289  Message: 1862

First off, thanks for a very active response to my inquiry. It's nice to see so much help potential out there!

This is a Crosley 1956 C model.

To answer the question as to the operation of this T-3, it did load up into the mil load/wattmeter that came in the deal. I've been told that they aren't that accurate but the 400+ watts I saw were promising. This rig had sat for a while so I did scrub out each deck and generally do a minor once over to mounting screws, contacts etc. Let it sit a good week with a fan on it before I applied the juice, which was ramped gradually with a variac. Got the coax to it in the garage but it hasn't seen the antenna yet. Next will be the mic hookup and audio check.
First though I have to deal with the long wire that came down in the early summer storms. Need to weed whack to get back to the tree I'm using and then get a copperweld wire up. I can get about 200' of wire back there. As former racer Cale Yarlboro(spelling) once said "she ran good till she blowed", so it will be nice to get hooked up.

Well off to Harpers Ferry for some history this weekend. Won't be doing mail till Monday for any further reply's.

Thanks again,

Bob

# 1864. T-3 Tag Question(s)

Yahoo group: T-368_BC-610
Date: 2003-08-30 17:57:47 UTC
From: K3PID
Topic: 1864  Message: 1864

On the T-3, RF deck just below the name tag with serial number etc there are four holes that appear to be for an additional tag. The pattern roughly matches the tag on the BC-939 that cautions about reading the instructions before operating... Can anyone tell me what the tag says AND does anyone know where I might find one?

Ron,

On my F model there is not a tag, nor holes. Instead, it has a silkscreened box about the size of the s/n tag:

CAUTION
Before Operation Review
TM11-809 Packed with Equipment

Hopefully you can find a tag.

Hi Joe. I have it online (PDF file). Don't recall where I got it tho.

Have the following: TM 11-809 (no suffix), and TM
11-809-10, -10A, -20, -20B, -35, -35C

Total is abt 90 meg, easy fit all on a CD. Who wants one? How about $1
plus postage - this ain't a charity! :-)

Joe,

Yes. Dated 4/22/55 with one change covering T-368B, it was the original T-368 manual. Superceded (split out into) in 1958 by the three volume set TM 11-809-10, -20 and -35.

How is the reproduction quality? So many of the pdf's are either so darn dark that you can't use the pictures or so grainy that the drawings are not usable.

If yours are good quality I'll take a set!

Hello Group!

KJ5V, Lon Cottingham, provided a circuit for the BC-610/T213s for
setting up PTT operations.

It is extracted from the schematic for the Control C-1218/GR schematic.

Another "Beast" owner cleaned up the drawing and then attributed it
to me, BUT Lon did it.

It is available on-line at:

<http://home.comcast.net/~rbethman/BC-610-PTT.jpg>

Enjoy!

# 1873. Need BC-614 Speech Amp

Yahoo group: T-368_BC-610
Date: 2003-09-11 19:25:51 UTC
From: Bill Feldmann
Topic: 1873  Message: 1873

Hi All,

Hope I'm doing this right since I'm new to the reflector and just got my BC-610F working.

I'm in need of a good BC-614 speech amp. I would prefer the BC-614F model since my BC-610 is a F model and it would be a nice match.

However any model would work fine since I have to return the one I barrowed ASAP to get my BC-610 checked out.

Also thinking of driving my BC-610F off my Symetrics 528 audio system but need some sort of 500 ohm line amp to get 2 watts of audio into the BC-610. The Symetrics only puts out 20dbm max into 500 ohms.

+++++
You'll want to be absolutely sure of the coil voltage
and make sure that it agrees with the voltage of the
unit you're dealing with. There were versions with
120 Volt relays and 24-6 volt relays, too.

That may be why you have to change your's now? I'm
guessing.

+++++++
Well,....

The next thing to do would be to verify that it IS an "E" model all the way through, can't neccessarily go by the tag. Better match it up to the schematic and hope there were no mods done to it. Try to date it by the pictures in the manual, but be careful there, too, some of the pictures are out of sequence as to date of use of the modules pictured.

I did a whole start-up sequence for this transmitter, hopefully someone saved it, it's in the archives but I have no idea where and I'd hate to go through it again, I might miss something.

Keep us posted,

Joe

http://home.att.net/~r391/www_ott/t368.htm

Here's the place to start, Joe!

The interlocks will be the most failure prone item
that needs to be checked first.

Mine ALL needed attention. Check for burned wires,
poor alignment, bent decks, squashed springs, burn
marks on the contact surfaces. These will be reliable
if taken care of.

Next is to clean, then clean, then clean some more.
All of the HV ceramics should be cleaned to remove any
oily stuff that will conduct.

Check all the spark gaps on the HV components, set
them according to the book. Check the HV wire on the
power supply deck for cracks or dried out insulation,
especially where it goes through the holes in the
deck. Big problem there, the older decks ran both
wires through one hole, the newer ones used separate
holes for each wire. Arc overs in these holes are
tough to find!

Clean the plate coil to remove anything that will
conduct, spiders, dust, etc.

Check all of the HV wire for bad or pinched
insulation.

Check the wiring harness where it runs behind the deck
bolts for pinched places.

Check the antenna relay for corroded connections, my
decks were ok, but I think my cabinet got into some
salt water somewhere as all of the antenna relay
connections were corroded like they'd been on New York
highways in the winter.

Oh, ... check the HV wiring and insulators to see that
they're clean and in good shape,..... did I mention
that yet?

Check the pick up shoe on the RF deck for a good
contact and alignment.

Check the BNC connectors on the speech amp for solid ground, check all of the audio line for good grounds on the stuff that is supposed to be grounded. This is where ultra-sonic modulation starts, not good.

Install a new three wire, 10 gauge power cord and make sure its grounded well inside the transmitter. I removed the plug on the back and put a 1 1/4" X 3/4" Plumbing reducer in the hole held in with a 1 1/4" electrical lock nut. Inside that I put a Kellem-type strain relief connector sized for the 10/3 cord.

This should be connected to a 30 Amp 120 volt circuit. Well grounded, of course.

And then if you get that far, check the HV insulators for cracks and to see that they are clean, also pay special attention to the insulation on the HV in the power supply deck.

Check the cabling in the RF deck to be sure its not in the FSK mode, you'll need the manual for that.

Check the fuse size in the power supply deck.

Put new bearings in the fan motors.

Check the condition of the Filament Voltage pot, this gets very hot, mine had a Chernobyl spot on it.

I had one relay that had one set of contacts welded shut, so you may want to check the function of all of them before you put power to it.

Not a bad idea to go through the manual and do the resistance checks at every tube socket and plug. This will give you a "baseline" for later troubleshooting, you'll know what it did when you got it, before the trouble showed up. This may also show problems if there are any.

Joe's rule: If you turn it on and it works the first time, ..... you didn't learn anything.

Sorry if I am beating this to death but sometimes a fellow just has to know! The hemispherical shock mount devices that are between the T-3 and the double H frame. Can anyone give me any details of the construction and/or materials? Also, it would be super if someone had one apart and could take some pictures... OR maybe these mechanical devices are covered in a manual????

Tnx

From: Trevor Lewis
Topic: 1879  Message: 1880

It's been a long time since my T-3 was off of the base, but my memory is that these shockmounts are basically a steel plate on the bottom, with an inverted cup on top, and a very heavy rubber, probably reinforced with something, in between. They looked very similar to shock mounts that I have seen on other mil-spec mounts, only a heck of a lot bigger to account for the weight of the T-3. Someone that deals in huge military stuff like www.murphyjunk.com might have something similar. But assuming your T-3 will be used at a home QTH, I think you could shape hardwood blocks to the proper shape, paint them grey, and never notice the difference

I've seen large shock mounts at Murphy's. The kind with the spiral of wire rope are more common now.

Greetings to all,

I am looking for some 26Z5 or 26Z5W rectifier tubes. For those of us who do not recognize this number, it is the 9 pin miniature rectifier that us used in the R-390/390A/725 receivers. Cash or trade.

Topic: 1886  Message: 1886

Subject: 26Z5 tubes

Thanks to all of you who responded to my inquiry on 26Z5 rectifier tubes. I had offers ranging from $25.00 on the high side to $7.00 on the low. Ended up trading some 4-65's for a batch of 26Z5's. Apparently there are still plenty of them out there at reasonable prices.

Neon sign shops use wire that will easily handle the job. Its thick like the old stuff and stranded copper inside - almost like #14 I believe. Its does'nt cost much either. If your lucky you might talk them out of the pieces that they are throwing out that day!

W8KXR, Gene in Ohio!

Too bad I don't have an antenna up for 1.885 MHz or I'd jump in, too.

Sounds good into Western NY, bustin' through the noise and fading.
The waveform on the modulation monitor is bouncing all over the place
due to the fading, but excellent copy.

The coils and tuning units might be ok! The transmitter however has most definitely been modified. Note: The plate current meter in the BC-610 is isolated from ground by an insulating mounting ring between the meter and the cabinet! If the HV meter modification does not take that into account it could be hazardous! Sort of makes me wonder what was going through the persons' mind who made the modifications. The unit looks OK, and if you wanted to make it back to original, you could probably find a front "skin" that wasn't too beat up to replace the modified one. All told the iron is worth 300.00 so I estimate it will sell for around 450.00 - 600.00, solely because of all the tuning units and coils. Omaha is a long way from Buffalo so I think I will let it pass.

An additional note is due here, in that all the parts could be used to build a "HB" 1KW input rig!

From: Tom Mackie
Topic: 1899  Message: 1899

Hello all T368 owners.

Do any of you have a want or need for those restrictive speech amp filters? I was cleaning up this weekend and found both which I had removed from a modified T3 speech amp. Since they are originals, maybe some of you want to be sure all stock components are in place!! Let me know if you have a need and I will mail them to you - N/C.

Just so the purists dont think I am hacking the big rig, the current speech amp has the filters installed (neatly bypassed). So just in case we want to have a bad audio night, I can get it all back on line in stock form.

73, have a great holiday
Tom

# 1905. T-368 Mod iron gap setting

Yahoo group: T-368_BC-610
Date: 2003-12-05 14:14:15 UTC
From: w1vwl
Topic: 1905  Message: 1905

Hello group

I'm hoping someone can help with the correct setting of the spark gap
on the T-368 mod iron. I've gone through the manual and can find no
specific info on the correct setting. I've heard everything from
an eighth inch to over a half inch, but know one seems to know for
sure.
I would hate to hurt the iron as I imagine its not cheap to replace.
Thanks a bunch. Any help will be greatly appreciated.

Hi Bob,

You have broken military protocol by reading the manual. In order to foil enemy attempts at proper radio operation, certain secret details have been omitted.

Knowing that, on the side of my mod iron is printed 'set spark gap .020" +- 5%'
Go into the rig and see if yours has a spec printed on the transformer itself. Since I have not seen a spec in the manual I wonder if it may depend upon the manufacturer/iron subcontractor to set the spec. Mine has printing on the forward face of the transformer so you dont have to take the deck out to read it.

Hope to hear you on 160 this weekend. The WX looks like it is shaping up to keep us indoors playing radio all day Saturday.

73

Subject: [***SPAM***] - [T-368_BC-610] T-368 Mod iron gap setting -
Found word(s) free cartridges in the Text body.

Hello group

I'm hoping someone can help with the correct setting of the spark gap
on the T-368 mod iron. I've gone through the manual and can find no
specific info on the correct setting. I've heard everything from
an eighth inch to over a half inch, but know one seems to know for
sure.
I would hate to hurt the iron as I imagine its not cheap to replace.
Thanks a bunch. Any help will be greatly appreciated.

Anyone in the Washington / Baltimore area (or within, say, 500 miles of Washington) have a T-368 they would be willing to part with for a reasonable price? My basement shack gets kinda chilly in the winter!

Yup, I get 523.4 by using Yahoo>>Maps>>Driving
Directions.

I say: "Go for it!!"

Then you can stop at Fair Radio on the way back and
get any parts that are missing or spares!

ROAD TRIP!

Or, if need be, we can come up with shipping
assistance of some kind.

Yup,

Time to fire up the ol' BAS&RRV!!

Boat Anchor Search and Recovery/Rescue Vehicle. At
least a 3/4 ton PU, covered, of course.

The recovery vehicle last Christmas was the Jeep Cherokee pulling a rented 1 ton trailer from Mesa AZ. I bought the SRT-14/15 from August Johnson who posted the military manuals...nice man! In years before I drove to Northern California to pick up a new RAK/RAL pair with all the bits and another was to swap an R390A( Stewart Warner 1959 and CV591A) for a BC610I, then another was a high Desert run for WWII tank radios plus Central Electronics 10A etc...seems like once a year or so I do the "Radio Ramble." The 1964 GMC pickup works fine for these efforts, ~8^), too.

I stayed in a Mexican Flea bag motel in Gila Bend AZ

I have an old VW Vanagon with a blueprinted and balanced 100-hp
engine that I use to tow a 2000lb. popup camper. Unfortunately,
it's blown a head gasket:( Once I get that fixed, I should be
back into the boat anchor rescue/adoption/repair action!
With the middle seat out, there's a *lot* of room in it!

Well, my other "BoatAnchor Mobile" is a restored 1974 Westfalia Popup camper. Damn thing has retrieved the elusive RALus Americanus with it's running mate RAKus Low frequentus. The Jeep dragged home a Navy TCK last Spring.~8^0

I can see the headline and news story now:

Medium Strength Earthquake Traced to Large Sinkhole in Arizona

Authorities are baffled after tracing a modest earthquake to a large sinkhole at the home of an amateur radio operator and heavy equipment collector. Neighbors are reported to have said: "I just KNEW there's be trouble sooner or later!" and "No outbuilding I ever saw just sank into the desert like that ... why it's completely out of sight at the bottom of that huge hole."

One investigator emerged from the hole carrying a shard of glass that said: "EIMAC 4-1000". He refused to comment on the significance of the find. Police had cordoned off the hole and also were keeping curious onlookers away from strange black wires that crisscross the property.

An ancient Volkswagon Camper was seen being removed by trailer from the property and may have been involved somehow in the mishap. The owner was rumored to be overseas on assignment at the time of the collapse and calls to the residence were not answered by press time.

Ah yes, my BAS&RRV at the time I acquired my T-3 was a 3/4 ton SuperDuty Ford-- which never had a better ride than when I was dragging the T-3 back from the Canadian border. Alas, as soon as it went off warranty, the Ford began to eat me out of house and home, and thus went down the road, and the T-3 still awaits adequate time to troubleshoot (sigh) some year. At least I did get ahold of a T-3 and did it while I had the right vehicle to haul it home, and some day the T-3 will light up the ether once again

Hauled my B&W T-368C back from near Cleveland in my wifes Chevy Tahoe. Boy was that a job getting it all in the back of that. Even worse getting it all out. Even the Tahoe squatted down a bit. At least it was all interstate back to north of cincinnati. Even had it on the air by the next day. But then K8TV had it all fixed up with the proper mods and ready to go. Its been doing great ever since. Still turn on the 32V once in a while but really like the T3 on these cold winter nights. Rig is in the basment. John

++++
I thought Ohio's Interstates were "expansion joint
hell". Especially in a 3/4 four wheel drive Chevy PU.
The secondary roads were MUCH better, not too many
stops either. I'd go that route if I did it again,
easier on the ball joints, too.

Joe

I think I have all you guys beat...

T-3 here traveled 70 miles to my qth as a "kit" rig in TWO high mileage pickups...

One an old Mazda that never had more than 100 factory hp and no compression and the other an equally old Toyota with no compression, period... both equally useless for anything past a trip to the gas station...

As expected, both trucks performed about the same... slow and used a lot of oil...

The Toyota for some reason, went faster going down hills... we never did figure this one out... we didn't try either...

Myself, I was happy to get back alive let alone with the T-3...

I think I have all you guys beat...

T-3 here traveled 70 miles to my qth as a "kit" rig in TWO high mileage pickups...

One an old Mazda that never had more than 100 factory hp and no compression and the other an equally old Toyota with no compression, period... both equally useless for anything past a trip to the gas station...

As expected, both trucks performed about the same... slow and used a lot of oil...

The Toyota for some reason, went faster going down hills... we never did figure this one out... we didn't try either...

Myself, I was happy to get back alive let alone with the T-3...

Nah, they've fixed them up since your trip, Joe. I hauled a 1400 lb
broadcast transmitter across the top of the state back in July using a
Ford Ranger and a U-Haul trailer, wasn't bad at all. Iowa/Nebraska
though...different story. Illinois was a mess, too.

Oh, I dunno 'bout that! Now, I can't tell it as 'my' story because it was someone else's rig (W1RC), but we started in the middle of the state with his car and my Ford Ranger, drove to the western edge to pick up his new T-368 (really did look like new, too), then drove completely back across the state to his place over on the eastern edge. Lotsa miles, but the ol '92 Ranger didn't even break a sweat, even though it was bumping 200K at the time. Did squat a bit, but nowhere near what we expected. Three of us loaded it, in pieces. Mr Mike and I unloaded it, in pieces. And nobody got in our way on the road. Probably because Mike's car is a retired State Police Crown Vic, complete with spotlight and scary paint job. He might've scowled at them, for all I know.

If nothing else, it was a helluva way to blow off an afternoon of work on a sunny summer day.

Yes, I'm still looking. And no, the RF deck above my garage has not yet sprouted a cabinet, mod deck or power supply deck. Just dust. But I live in eternal hope.

No complaints from me, Mike - and I think most of the T-3 group will appreciate a warning from others provided it isn't just a flame war or some kind of retribution. I have dealt with Luc only once when purchasing my CR-91A from him and he tried to get out of including the cabinet and manual with it that he had advertised. It took a bit of strong-arming to get him to finally send the manual, but he did. Luc appears to be a creature of opportunity, to put it mildly.

I have a copy of a letter to the CAWA (Canadian Antique Wireless Association) from a fellow in California who got hosed by Luc on something Luc offered for sale in ARC, warning others to beware of this individual. So I think it's safe to say Mike that you, Trevor, and anyone else warning others about Luc is right on the mark. He has a lot of stuff, some of it very nice and very rare stuff. Unfortunately I think there are some distinct parallels between his operation and the one in NE Texas.

Oh, the stories I could tell..... (o:

# 1938. Sidetone question

Yahoo group: T-368_BC-610
Date: 2004-01-03 21:21:07 UTC
From: K3PID
Topic: 1938  Message: 1938

The sidetone output of the T-368 is taken through a cap from the wiper of the 500 Ohm cathode resistor of the cathode follower. Is it normally connected across the "output" side of the 600 Ohm audio output of the R-390? If so then the level of the sidetone is controlled by the cathode resistor independ from the R-390?

K3PID - Ron H.

# 1939. WTB: Speech Amp for T-3

From: kf0hr
Topic: 1942  Message: 1942

Hi all T-3 users. My blower fan in my T-3 is just to loud.
I pulled the fan out and relubed the motor bearing and that made
no improvement at all. I don't think the bearings are whats loud.
What have others done? Remote the fan, out side different room?

Maybe I can just unplug it.HI HI

I don't like to use headphones, but what do others do?

Thanks,

Teran KFØHR in North Dakota

# 1943. Re: [T-368_BC-610] Blower fan on T-368

Yahoo group: T-368_BC-610
Date: 2004-01-21 02:57:51 UTC
From: Trevor Lewis
Topic: 1942  Message: 1943

The fans are infamous for being noisy. The bearings can seem perfectly smooth and yet be quite noisy. Often the bearings are simply worn to the point where they must be replaced and not just re-lubed, and the bearing noise seems to resonate loudly in the cabinet. Some people have also done more major "drilling and blasting" to the T-3's cabinet (enlarging the exhaust opening) in order to make for easier airflow, and thus less backpressure and noise (see/ search earlier messages here in the group), but others consider that as bordering on or being defacement of these historic units. I think you'll find that replacing the bearings will make a dramatic improvement. Also, as you probably know, there are two fans, one in the main cabinet and one on the RF deck-- check and consider replacing bearings in both.

Mine definitely needs bearings before the noise level will be tolerable, but then again, it also needs other work before it will be fully "air worthy"

Subject: [SPAM] Re: [T-368_BC-610] Blower fan on T-368

The fans are infamous for being noisy. The bearings can seem perfectly smooth and yet be quite noisy. Often the bearings are simply worn to the point where they must be replaced and not just re-lubed, and the bearing noise seems to resonate loudly in the cabinet. Some people have also done more major "drilling and blasting" to the T-3's cabinet (enlarging the exhaust opening) in order to make for easier airflow, and thus less backpressure and noise (see/ search earlier messages here in the group), but others consider that as bordering on or being defacement of these historic units. I think you'll find that replacing the bearings will make a dramatic improvement. Also, as you probably know, there are two fans, one in the main cabinet and one on the RF deck-- check and consider replacing bearings in both.

Mine definitely needs bearings before the noise level will be tolerable, but then again, it also needs other work before it will be fully "air worthy"

Hi all T-3 users. My blower fan in my T-3 is just to loud.
I pulled the fan out and relubed the motor bearing and that made
no improvement at all. I don't think the bearings are whats loud.
What have others done? Remote the fan, out side different room?

Maybe I can just unplug it.HI HI

I don't like to use headphones, but what do others do?

Thanks,

Teran KFØHR in North Dakota

Hi Teran,

I punched out the inlet hole in mine with a 4" electrical conduit punch, that reduced the pressure there and allows more air into the blower. I also made a "turning vane" for that hole that forces the air to enter the blower parallel with the shaft, instead of just hitting one side of the squirrel cage, that was a big reduction in noise! My T-3 also has the ductwork that moves the inlet to the left-hand end of the transmitter which quiets it down a lot, too.

The bearings are not hard to change just pay attention to where all of the thrust washers are when you take it apart. The bearings are a standard size and should be available at any dealer that sells bearings.

You may need a gear puller to get the old bearings off, I didn't. You also may need a press to replace them, I used a deep-well socket that fit the inner race and a vice.

You could also try mounting the blower with rubber washers.

Some don't even use the blower but I think it helps keep the shack warm.

Hello Teran,
If the unit has suffered at the hands of the inexperienced, then the "Air System" integrity
has probably suffered, which explains the excessive noise you are getting with your unit.

First, let me say the ambient noise level of a properly maintained T-368, as used in the
Military AN/GRC-26D radio set, was not noticeable in those units while they were in
service. The Blower system, if properly maintained, was at an acceptable level in the
"Mobile Shelter" to allow the operators to monitor either of a pair of R-390(*) receivers
without any trouble.

I fear however that with the popularity of these units, and the general lack of proper
care given to the "system", the noise will always be a problem. In order to quiet the
T-368 down it is necessary to follow the Steps laid out in the "Depot" maintenance
manual. Anything short of that is a waste of time. Bear in mind it is an "air system", and
the intended purpose is to cool the components of the equipment, and allow a 24/7
operational environment for it. When in doubt, MILTFDJ-1!

Trevor, someone whose email contact list contains your email address has a mail-based worm that sends out stuff like that, using that person's contact list to grab addresses to use for spoofing. I've had this happen several times, and even got blocked by a couple of ISP's once because my stolen email address was being used to propagate a virus. As far as I know, there's not much you can do about it except stay clean with Norton, and grin and bear it. If EVERYBODY on this list would run a good antivirus program that scrubs emails in and OUT 24/7 this problem would go away, but there's always that chosen few, and therein lies the problem.

Hi Joe,

The bearings in the blowers are of the sealed type,
unless you are good at prying off the covers on them
you won't be able to lubricate them, actually, prying
off the covers isn't that hard, getting them back on
is NUTS!

Best to just replace the bearings with new ones.

Joe

Joe,

Joe is right. the ABEC rated miniature precision bearings used in most such applications are either shielded, sealed or both, and were supplied with adequate lubrication for the normal expected life of the bearings. They weren't intended to be opened up and re-lubed. If it were a case where the item containing the bearings was NOS or nearly so and had been in storage for half a century or more, exceptions could be made, as the original filling might all still be there but have had the volatiles "go elsewhere" so that the grease is hard but the bearing itself is hardly used. But even so, although it isn't too difficult to remove the seal or shield from one side, it is a bear to reinstall it properly. The cost of new bearings generally doesn't warrent the effort in my experience/opinion.

There are some exceptions. The BD-77 and PE-73 for the BC-191 and BC-375 respectively have bearings that need to be lubricated periodically. And anything with sleeve bearings does as well. But most of the military applications in dynamotors, inverters and at least the larger blowers don't.

I know this is a long shot, but here it is. I need the coil assembly
and coils for 160-40m. anybody just happen to have any spares?

# 1956. BC-610 OPERATION ON 160 METERS QUESTION

Yahoo group: T-368_BC-610
Date: 2004-01-24 15:40:35 UTC
From: Bill Feldmann
Topic: 1956  Message: 1956

Hi All,

I have a BC-610F that has been working very well on 160 through 40 meters. However I noticed the output power was down on 20 meters. Upon inspection of the final network I found a 1000pf door knob cap had been added between the junction of CH4, R9 and the center tap plug for L7, the final coil, by a previous owner. This added cap would ground the final coil center tap for RF. I removed the cap and the BC-610F worked fine on 20 meters.

The question is why the cap was added. Without the cap it works just fine on 20 through 75 meters. However after reading the section in the manual on operation below 2mc I am scared to try it without the cap on 160. In the manual they say it's necessary to remove or disconnect one end of R9 when operating below 2mc or the choke CH4 and/or the resistor R9 could be damaged. I wonder if the added cap that would bypass RF at the coil center tap was another way of protecting these components when below 2mc? If anyone has any experience with this I would like to know.

Also I wonder if any of you that operate 160 meters with a BC-610 have found it necessary to disconnect R9 as recommended in the manual, TO 31R2-3SCR399-21. Maybe it's only necessary to disconnect the resistor when going much below 2mc and it isn't a problem with R9 connected down to 1885kc which is as low as I go for AM phone.

With the cap installed I have had lots of AM QSO's on 1885 and 1925kc with not problems but it messes up the operation on 20 meters. I use the 1.5 to 2mc coil when on 160 meters but a modified exciter module for 2mc by adding caps to the doubler and internal amp circuits.

Thanks,

Bill N6PY

# 1957. Re: [T-368_BC-610] BC-610 OPERATION ON 160 METERS QUESTION

Yahoo group: T-368_BC-610
Date: 2004-01-25 00:08:35 UTC
From: Trevor Lewis
Topic: 1956  Message: 1957

Hi Bill-- As a T-368 owner (and one who still needs to find the time to give my T-3 the TLC it needs to get fully debugged and on the air) I am not the least bit familiar with the details of the BC-610. But I know from other old rigs that I've worked on that, while there are some mods that are just botches and butcher jobs, there are others where there was a method to the former owner's madness, and "restoring" the rig to exact stock sometimes uncovers other faults in the rig that the "odd mod" was intended to (and did) avoid (and sometimes, if the "mod-der" had some good sense, without major ill side effects). I could bore you all with stories about things I discovered along those lines in the ART-13 I used to own. With that in mind, and since it sounds like your rig works well on 160 with this odd doorknob cap, and works well on 20 without it, is there any chance you could sneak a vacuum relay in there, and hide an actuation switch somewhere else, all without doing any major "drilling and blasting" so that you could switch the cap in and out? I have gotten small vacuum relays from http://www.mgs4u.com/ -- that have are handy for switching RF or KV type tasks-- see his rf components and "presidents page."

Having just blabbed all of that, one of you who has more of an actual clue about the BC-610 than I do will probably be able to point out some simple solution that I, not knowing the details of the 610, am oblivious to.... <8-]

Subject: [T-368_BC-610] BC-610 OPERATION ON 160 METERS QUESTION

Hi All,

I have a BC-610F that has been working very well on 160 through 40 meters. However I noticed the output power was down on 20 meters. Upon inspection of the final network I found a 1000pf door knob cap had been added between the junction of CH4, R9 and the center tap plug for L7, the final coil, by a previous owner. This added cap would ground the final coil center tap for RF. I removed the cap and the BC-610F worked fine on 20 meters.

The question is why the cap was added. Without the cap it works just fine on 20 through 75 meters. However after reading the section in the manual on operation below 2mc I am scared to try it without the cap on 160. In the manual they say it's necessary to remove or disconnect one end of R9 when operating below 2mc or the choke CH4 and/or the resistor R9 could be damaged. I wonder if the added cap that would bypass RF at the coil center tap was another way of protecting these components when below 2mc? If anyone has any experience with this I would like to know.

Also I wonder if any of you that operate 160 meters with a BC-610 have found it necessary to disconnect R9 as recommended in the manual, TO 31R2-3SCR399-21. Maybe it's only necessary to disconnect the resistor when going much below 2mc and it isn't a problem with R9 connected down to 1885kc which is as low as I go for AM phone.

With the cap installed I have had lots of AM QSO's on 1885 and 1925kc with not problems but it messes up the operation on 20 meters. I use the 1.5 to 2mc coil when on 160 meters but a modified exciter module for 2mc by adding caps to the doubler and internal amp circuits.

Thanks,

Bill N6PY

# 1958. WTB: T-368 Filter Choke !HELP!

Yahoo group: T-368_BC-610
Date: 2004-01-27 05:14:28 UTC
From: radarparker
Topic: 1958  Message: 1958

Hello All,

My T-368E is sick. There is 2.5% @120Hz modulation on the carrier. In examination, I found the Filter Choke in the HV Drawer Shorted. A quick resistance check shows: 24 Ohms, the spec is 65 Ohms.

Anybody out there have a spare choke??

Any help would be greatly appreciated.

I'm almost finished with my restoration and just need the choke to button it up!

Best Regards,

Jeff Parker

# 1960. BC-610 Pic Needed ASAP for QST (This weekend!)

Yahoo group: T-368_BC-610
Date: 2004-01-31 23:18:20 UTC
From: Tom Norris
Topic: 1960  Message: 1960

I'm posting this for John Dilks from the Boatanchor list, he is needing a decent BC-610 photo for his QST column -- contact him and NOT me!

---

Hi Gang,

I'm looking for a good high resolution photo of your BC-610, and hopefully the BC-610 located within your station, for use in my QST column. Photo should be well lit, in focus, high resolution (at least 400k - better is 700+k) and in .jpg file format. If you can, turn on the rig so the panel lights are on. You in the photo is OK too.

I need the photo this weekend. The photo I have, and was planning to use, is not real clear. I'm hoping to get a better one.

Any questions, email or telephone me 609-927-3873.

Email address is oldradio@...

Thanks & 73, John Dilks, K2TQN

Hello Jerry and list,
The primary side is in fact two separate windings for the tubes used.
At top left facing the transformer, goes to plate of one tube, top right
goes to the second tube plate. The two bottom terminals are to be
jumpered
together for two tubes, and the B+ is connected to this jumpered
connection
at either terminal. The Transformer is made by Stancor for use in the
BC-610(E)
type transmitters. It is classified and in the parts list as,
transformer,
audio frequency: primary 2100 ohms center tapped, 225 MA DC. Secondary
is
8000 ohms, 250 MA DC 7 drawing part number SC-C-23868.

I have a spare if it is needed/wanted.

Hey Roy,
Nope I wrote what I was reading from the Parts Manual, that reads 2100.
However, you
are correct the value should be 21,000 as all the others are 21,000, that
are listed there.
Military Manuals, sometimes they do have typos' I guess I was going to fast,
or not had
enough COFFEE, please forgive me for not paying attention.

Thanks

# 1966. T368 generating harmonics

Yahoo group: T-368_BC-610
Date: 2004-02-10 12:52:52 UTC
From: Tom Mackie
Topic: 1966  Message: 1966

All,
Last night I was operating 1940KHz and I later found out from a couple hams in New England that I was putting out a strapping signal on 3880KHz also. I have checked for blatant things like antenna connection, tune etc and I don't see a problem. I modified the RF deck a few years ago to remove some of the excessive C. I would have to refresh my memory on what I have done. I just noticed dip and max output do not occur at the same spot. I have been tuning for dip.

Any ideas on how to track down this harmonic?

FWIW, I had the same report many years ago when the T3 was in stock form. I thought the mod to the RF deck had solved it.

Tnx

Tom W2ILA

Hi Tom,
Bet you a nickel you either changed the cap c41 or the components in the "L" network,
they are directly responsible for suppression of spurs on the output to the T-368. They
work in conjunction with the Plate blocking cap to keep them at a minimum level. The
modifications to the plate circuit, cause various squirrelly things to happen to the T-368
among them is burning up the 4-400 plate choke. MILTFDJ-1 my friend.

# 1969. fixed the harmonic generator

Yahoo group: T-368_BC-610
Date: 2004-02-15 19:17:19 UTC
From: Tom Mackie
Topic: 1969  Message: 1969

Guys,

I fixed the problem of simulcast on 1940 / 3880 from my T368.
Jim, WB2FCN gave me a clue to look at C41. Hmmm. it was shorted. That forced me to tune to values on tune/load way outside of the curves in the book (as suggested by Joe W3GMS). The final was doubling. I could not tune to book values.
I now have a 1000pf bathtub cap in C41 and the tuning and loading are proper per the book suggested curves. I can't hear myself any longer on 3880 where before I was S-9 with the antenna disconnected.

Thanks for all the help everyone!

From: Trevor Lewis
Topic: 1981  Message: 1981

My April QST arrived today, and in the "Old Radio" Column, there is a good two page story on the BC-610 and its history (and a sidebar on Joe Cro, N3IBX, of this list, pictured with his HT-4). Interest in vintage radio sure has come a long way from 20 years ago when the old timers at the ham club I belonged to back then thought it was a hoot that this "kid" was actually willing to take away some of the old radio stuff & parts (now I wish that I'd taken, and kept, more of it).

# 1983. coax power/ age

Yahoo group: T-368_BC-610
Date: 2004-03-12 04:50:43 UTC
From: Trevor Lewis
Topic: 1983  Message: 1983

pardon this off-topic question, but it does indeed relate to eventually setting up my T-368; I figure some of you folks may have some insight or be able to point me in the right direction.

I picked up some nice mil-surplus Bird Coax Switches that I want to use to switch between my T-3 and other rigs. But these are an oddball variant of the Bird "Coaxwitch"-- instead of an "N" connector on the back for the "common" pole of the switch, there is a short stub (very short stub) of very old looking RG-55 coax (yes, 55, not 58 or 59) hanging out of the back of the switch. I've opened up the switch and it looks like it'd be an "adventure" to try to install/ adapt to some new similar-size coax. I've found specs that say that RG-55 is good for 950 watts up to 30 MHz, but am concerned that this old ratty stuff may handle less power. Am I correct that the coax probably has not only become more lossy (not a worry at HF for such a short piece) but more limited in its power-handling capability over the 40+ years that look like they've passed since its manufacture?

Thanks & 73

# 1988. WTD: BC-610E Parts

Yahoo group: T-368_BC-610
Date: 2004-03-31 00:38:11 UTC
From: Dale Hagert
Topic: 1988  Message: 1988

I am getting ready to send my BC-610E sheet metal out for powder coating and need the metal manual box on the right side. Does anyone have one they would like to sell or can give me the dimensions for I can have one bent up.

I am also looking for the plastic PA Tuning dial as mine is broken. and would like to find the metal ID plate from a BC-610E. If anyone could help, I would truly appreciate it.

Question for the group.

Anyone know where the E. H. Scott RCH receiver was used or when? I have one in really nice shape that I am bringing to SLO for MRCG meeting for display. Would like to be able to tell a little about it's history and use.

Thanks,

Mike

++++++++
Even their "Used-Ugly" ones work well enough, and they
are a real deal at only, I think, $50 each.

Yahoo group: T-368_BC-610
Date: 2004-04-11 03:52:47 UTC
From: James M. Walker
Topic: 1991  Message: 1993

About 4 years ago, a guy was selling these units for 15.00 each, catch was he had removed the resistors to sell them individually as they are indeed non-inductive type. So I bought them from him, and then ran into another guy who had more than enough of the resistors to replace the ones
removed, cost was 2.00 each. I refurbished 4 of the units, had to get a few 52 ohm 1/2 watt 1% resistors off of old 3COM network cards, set them up and calibrated them to a bird wattmeter into a 1KW dummy load and, ended up with one each for the two BC-610(*) transmitters , my T-368, and also the main antenna path to the low power stations. A very good unit
for checking power and also SWR for the systems. The Schematics and a manual are available through the "ETM" site or on my web pages.

Fair radio sells them for 45.00, but they also show up on this E-place for between 25 and 45 dollars. The things are virtually indestructible so they are a good deal at this LOWER more realistic price. The 2003 Fair Radio catalog has Government Reconditioned ME-165/G units for 125.00 and manual repro for 8.50, which may be why the guy is asking such a high price for his. It is a BIT much however.

There are lots of guys with them, that don't use them, because the unit uses "N" type connectors, I haven't figured out why however.

# 1995. Springtime!!

Yahoo group: T-368_BC-610
Date: 2004-04-17 03:52:28 UTC
From: redmenaced
Topic: 1995  Message: 1995

Hi,

I'm putting a new 480 Volt service in a local factory that
makes,..... what else,.... SPRINGS!!

Bill, the owner, says he likes doing custom springs, short runs of
custom springs! If all you need is a dozen, he'll do a dozen.

Angelica Spring Co.
99 West Ave.
Angelica, NY 14709

585-466-7892

Send him a sample, or specs, and see what happens. Good guy to deal
with, too.

Oldham coupler springs? RF deck springs? What do we need?

On another subject,

The heavy equipment repair guy up the street told me his 1953 Lincoln
welder was acting up, arcing over inside, smoking, etc,... but only
when he ran it on DC.

Gee, I thought, what could the problem be? 8^/

Sure enough, there is a HUGE selenium rectifier stack inside, about
6" X 12" X 18". It was making HUGE beautiful, blue sparks when he
showed it to me. His wife said he was real sick, 102+ fever, Sunday
after spending most of Saturday welding with it. But he was only
sick for a few hours,..... lucky?

He promised me he'd only use it on AC until we round up some new
rectifiers for it.

Joe

From: Tom Norris
Topic: 1997  Message: 1997

Not a 610 or 368, but a BC-375E

You know where, item 3091505438

Nice looking transmitter with 5 tuning units and dynamotor,
listing appears to have not attracted much attention and
is nearly ended with less than 50 bucks on the whole shebang.
Seller says tx is complete far as he knows.

Not my item, no financial interest, etc.

# 1998. Yahoo Web Beacons

Yahoo group: T-368_BC-610
Date: 2004-04-20 19:46:06 UTC
From: w7qho@aol.com
Topic: 1998  Message: 1998

FYI.

Yahoo is now using something called "Web Beacons" to track Yahoo Group users around the net and see what they're doing and where they are going -- similar to cookies. Take a look at their updated privacy statement:

http://privacy.yahoo.com/privacy/us/pixels/details.html

About halfway down the page, in the section "Outside the Yahoo! Network," you'll see a little "click here" link that will let you "opt-out" of their new "service." Once you have clicked that link, you are opted out. Notice the "Success" message the top the next page.
Be careful, here, because on that page there is a "Cancel opt-out" button that, if clicked, will undo the opt-out.

I have personally chosen to opt-out, but make no recommendation to others, one way or the other.

From: K3PID
Topic: 1998  Message: 1999

Here is an explanation...

http://www.allaboutcookies.org/web-beacons/

As insidious as it is, it only applies on "browser" access. If you never actually visit the Yahoo site it shouldn't affect you. The really down and dirty part is that even if you choose to block cookies, most browsers will always allow pictures and images ( i.e. web beacons). They haven't snuck anything in via the group mailings YET!

I am looking for a good, working PRC-104 in good or better condition. Anyone have one they would like to part with? Would prefer one with the AM module if possible.
I will be MRCG meeting at SLO to save having to ship it if anyone with one will be there.
I have a PRC-74 with all accessories, AC power supply/charger for a partial trade if anyone is interested.
Also have an RCH receiver with case and shock mounts as a partial trade as well.

AH,
Where did you see the picture? Need that info for reference to determine what it actually is. For instance there is a large shelf in the AN/GRC-26D.
on one side it is used for storage, and there is a smaller section on the
other side broken up by a TT-76 and a pair of TT-98 type, teletype devices.
Does this "shelf" actually touch the T-368? Or as I suspect is it just in
close proximity to it!

With the bulky size of the T-368, and also the need for the ability to access the front from time to time, I would think a shelf in "front" of the T-368 would be a bit of a hassle.

I have acquired a lift table, good for around 1000 pounds, which I use to
move the larger boatanchors around and also up to the workbench. I find it ideal for removing the modulator deck and the RF deck from the T-368. I might also mention, that due to the "excessive" weight of the power supply deck, that I have just settled for, removing the cables, and then sliding the deck out until it clears the case and the higher up rail, then
tilting the thing down onto a thick throw rug. then standing it up on the
front handles, thus giving me unobstructed access to the bottom of the chassis.

In conclusion, where did you see this picture?

From: Chuck Strozier
Topic: 2007  Message: 2011

Greetings,
My name is Chuck Strozier, a former us military an/grc-26d repairman, and from memory & TM11-264B There are 3 separate tables supporting the tty machines on the right side of the hut with about 24" of clearance from the edge of the table to the T368 to allow the decks of the t3 to be pulled out and removed for service. The only other surface is a cabinet located on the left side of the hut.
Hope this sheds some light on the discussion.
Chuck

The photo is NOT of the T-368 in a military installation. Many items don't belong in a military configuration, such as the D-104 microphone, Bud or some such box with the speaker, R-390A without the cabinet and not in a receiver rack, on top of the T-368 where the RTTY modulator would be mounted.

Whoever built that contraption, it looks nice anyway. However, t'd be a bit too noisy to use the microphone right in front of a T-3...

Ah ha,
Just as I thought, it is "homebrew" nice setup though. It is yet another indication of the amount of space taken up by the T-368 and R-390(*) RX. I constantly suffer from lack of space here, and at one time I had some many "Big Rigs" down in my basement, I thought the house would start to lean towards the "Heavy Metal"!

That is a good idea for the person that hasn't been "INFECTED" yet by the
Big Rig Bug, or as I put it, Radios increase to fill all the space in a given area. The idea is similar to the look Dave KA2J has for his T-368 position, except he uses a table, but I would venture, the space occupied
is nearly the same, because he has his EFJ KW matchbox in his picture!

Man I have to start an ant farm or something, that can sit on the corner of a table (small) along with the alarm clock!

Good photo though!
Jim

# 2018. Choke for T3 RF deck mods

Yahoo group: T-368_BC-610
Date: 2004-06-03 05:02:10 UTC
From: Jerry Kincade
Topic: 2018  Message: 2018

Ok, T3 mod experts: I want to do the standard RF deck mods (reduction of shunt capacitance) but it appears that B&W 800 chokes are like hen's teeth. B&W will cheerfully sell me a new 110 uH 802 (supposedly re-designed to be trouble-free on the upper bands, unlike the 800), but for (gag) $75.

As a more economical alternative, I have in hand a large NOS choke originally intended for an 8877 amp. It's a stout choke, 1" diameter, about 7 inches long on a ceramic core, but is only 95 uH vice the 110 uH of a B&W 802. It should easily carry an amp plus some. I want to be sure I can still fire up full bore on 160 through 20 after this mod without worrying about letting the smoke out of something. Of course, above 20M I couldn't care less. Any reason this choke shouldn't work just fine for the T3 rf deck mods?

Thanks,
Jerry W5KP

Jerry,

The B&W 800 (90 uH) does not have enough inductance for this application and will get warm on 75 and hot on 160M. There was a thread on this a while ago. The Yahoo web site http://groups.yahoo.com/group/T-368_BC-610/files/) gives one solution to this problem. Whatever choke you use in the plate circuit, make sure it exhibits no series resonances on any of the frequencies on which you plan to operate.

Incidentally, I opted for a simpler modification in my T368s. Noticeable top end improvement can be achieved by merely reducing the DC blocking capacity in the middle of the Pi-L tank circuit to .001 mf and doing the same to the RF bypassing on the incoming HVDC line. The tuning on 160M is affected somewhat with this mod but there is no apparent affect on output or efficiency. Reducing the value of 4-400 screen bypass cap would probably provide additional improvement but I haven't tried this.

Dave,

In looking through my manual on the PP-337 (TM 11-5070, Septeber 1955) I note a picture of a steel mounting rack for the GRC-9 and the supply. The text calls this as a "mounting bracket" for use in Operations Center AN/MTQ-1 (TM 11-5550). This ring any bells?

I like the price and all the specs (225 uH?? - wow) with the possible exception of the 4 KV rating... Is that enough for a T-3 at full "peak voltage" tilt? If so, this would certainly be the deal.

Should be OK, not sure just what the voltage rating on an RF choke means anyway. If the lug on the bottom looks too close too the chassis just mount the whole thing on a standoff insulator.

I installed this Choke in my T-3 a couple of years ago when I modified the RF deck.
It works well on 160 and up and seems to handle the voltages with no sweat.
The ceramic insulator has a threaded center so I mounted it on end near the 4-400.

# 2034. Re: [T-368_BC-610] Need back panel for T-368

Yahoo group: T-368_BC-610
Date: 2004-06-10 13:01:09 UTC
From: Jerry Kincade
Topic: 2031  Message: 2034

I kind of wondered about that - I've been running my T3 sans rear panel because I've been fooling with the mod deck so much and it's a pain to pop 600 dzus fasteners and unwire the blower every time I want to run some tests. I was a little worried this practice would cause something to heat up in the power supply or mod deck, but nothing at all out of the ordinary has been noticed. I suspect the lower blower is overkill for intermittent ham use of a military transmitter built to run key-down 24/7, as long as the rear panel is removed so some convection cooling can happen. Of course, you have to be exercise caution not to fry the cat, the grandkids, or the technician.

BTW, I have read posts where folks have found exact replacement blower motor bearings "for 98 cents each" or some such. Encouraged, I set out to replace mine, not because they are bad, but just because they are 50 years old. Two large bearing distributors in Oklahoma City spent about two weeks trying to cross part numbers to find exact replacements with no success. Their consensus of opinion is this blower motor was custom built under a Crosley government subcontract, and the bearings were an odd size, even for back then. They are 8 mm bore x 22 mm diameter x 12 mm width (foreign bearings?), and nobody has found anything that will work without some custom machining of the end caps or the like, which would quickly turn this into a $200 bearing replacement. If they do get noisy, I'll replace the whole motor instead for about $60 or so. For those who have good 'ol standard size bearings in their blowers, congratulations.

Jerry,

Try looking up Boca Bearings in FL.

It sounds right up there alley!

We get our metric sized R/C bearings through them.

# 2036. T-368 questions

Yahoo group: T-368_BC-610
Date: 2004-06-12 19:48:12 UTC
From: doran platt
Topic: 2036  Message: 2036

Just got my T-368 up and running.. 350+ watts out, no problem, and good modulation via a D-104 and bypassing the audio filters. Now a couple of questions. At 350 watts out (Bird) the plate reads about 150-160ma. Given the B+ and the expected efficiency, something doesn't add up? Meter cal is fine.. I did a series comparison. Could it be that my B+ is too high with a 120v input? Might I use the other taps on the primary of the HV Xformer? This is an "A" model with that feature. Next, my fan is sounding pretty horrible. I've had to rap it a couiple of times to get it going, but mostly it runs but sounds like an elephant in pain. I did remove it a tried to get some oil in the live end, but no joy on actually fixing it. Can these fans be disassembled and, if so, can you get them back together..hi! Finally, I (or someone) broke the 2K 37w resistor in the mod bias divider chain. I replaced it with a similar mountigg type but half (it would appear) the power rating (maybe 25 watts). I calculated the current in the divider and got a heck of a lot less than 37 watts!! The mod bias pot isn't a high wattage component, either... so I think I'm OK?? Any comments on the aforementioned would be most appreciated. If anyone has a spare base (with the long legs) they've removed and no longer need, I could use it. Tnx much de K3HVG

Jeep,

Have you measured the plate voltage (be careful!). The power transformer in your A model has a 6350 volt (CT) secondary and at 120 vac in your B+ should be running around 2800 vdc. At 160 ma plate current this comes to 440 watts in and at 350 out the efficiency would be 80%. Just about right. Plate voltage well within the specs of the PA and modulator components. Nothing to worry about, just enjoy.

++++++++++
Yes, most of them can be rebuilt easily. They have
sealed bearings so trying to lube them is a lost cause
without removing the bearing cover. You might as well
rebuild both of them and be done with it. I was able
to pull the bearings off with my fingers, but they
were tight, you may need a puller. A press to install
them would be good, too.

Joe

# 2039. WTB BC-342-N ID plate

Yahoo group: T-368_BC-610
Date: 2004-06-14 14:08:58 UTC
From: N6WIG
Topic: 2039  Message: 2039

I'm looking for an ID plate for a BC-342-N. Just got a nice one but it is missing the ID/name plate. Also would like to find some of the jack covers as well. In anyone has a junker they would like to part with or just the parts, let me know.
I live in San Jose, Ca so if you are local I can pick them up.

Thanks,

Mike

# 2040. Last T-368 Question (I hope...)

Yahoo group: T-368_BC-610
Date: 2004-06-14 20:56:23 UTC
From: k3hvg03
Topic: 2040  Message: 2040

One last question on getting my T-368 up and running, sans problems. It appears that the VFO (buffers too?)is/are more or less free running in my "A" model. When un-keyed, I get (of course) no grid drive nor IPA current. However, I get a 30db signal in the accompanying R-390A. When keyed, I note that this signal is appropriatly much stronger (no HV ). The problem may be intermittant in that I used the tx on a net this weekend and didn't notice the problem. I/we did note it during initial tests, but didn't pay too much attention. Any leads on this? Tnx de Jeep/K3HVG

Jeep,
do you have the T-368 manual with the change notifications in it?
If not I have the complete manuals 10, 20 , 35 for the T-368 I
can send them to you if your mail will allow large files, they are
in PDF (Adobe) format. Or you can go to my site and select military
and T-368 they are available at the top of the page.

# 2043. Send your Comment to the FCC about BPL

Yahoo group: T-368_BC-610
Date: 2004-06-16 15:27:44 UTC
From: Mark Foltarz
Topic: 2043  Message: 2043

Here we go...

1 . goto http://gullfoss2.fcc.gov/prod/ecfs/upload_v2.cgi

2. In box 1 enter 04-037

3. Fill in your name address etc.

4. Enter you thoughts on BPL in the comments section (Send a Brief Comment to FCC (typed-in) ) perhaps something like :

In Writing, I wish to persuade the FCC from allowing BPL to be implemented. The destruction or at the least, deterioration of the shortwave bands is not only a violation of ITU laws that protect international broadcasters from interference and jamming, it will be destroying many people's life hobby. Amateur radio will be reduced to users with high-power amplifiers and large antennas. Emergency communications will be hindered to levels directly responsible for the loss of life. Also, this will hinder military HF comms reducing national security

There are many technologies that make BPL unnecessary. BPL will never be able to carry the high bandwidth demands for mass distribution of video much less the up-and-coming HDTV.

Thank You!

From: redmenaced
Topic: 2045  Message: 2045

A Tune and Load turns counter panel for a T-368, priced at $40, no dealer in sight! Had both counters and gears, too.

Came back later he, and the panel, were GONE!

No idea who it was, was anyone lucky enough to make a good deal on it?

NO other T-3 booty in sight.

NOT SEEN at the Hamfest:

Gene Beckwith, W8KXR, his E-mail has been bouncing for months, anyone know where he went? Anyone seen, heard from, got a clue?

The weather was EXCELLENT!

# 2046. T-368 6000 tube source

Yahoo group: T-368_BC-610
Date: 2004-06-22 16:33:23 UTC
From: k3hvg03
Topic: 2046  Message: 2046

I understand that 6000 tubes are hard to find. I've found 2 sources that purport to have them, one of which is Antique Electronic. They list the tube as a triode but when asked, they confirm its a Tung Sol beam power tube. It would appear this is the requisite article, or at least I hope so... I ordered 2 of them! I'll let all know if it works out.

# 2047. ER DEADLINE FOR SAYING THANKS TO BARRY & SHIRLEY WISEMAN

Yahoo group: T-368_BC-610

From: W6PSS@aol.com
Topic: 2047  Message: 2047

Hi, AM Community!
Please give this a moment ur valuable time.
Time's running out for our opportunity to wish Barry N6CSW & wife Shirley farewell as they return to Barry's native Canada. Electric Radio's Ed. Ray N0DMS has graciously agreed in making as much room as necessary in this issue for you and me to publicly express our appreciation and Farewell to the founders of the magazine. Just a few lines will do. Ray will combine them into a send off tribute. He'll make as much room as necessary! But the deadline is very near! Today or tomorrow, at the latest!
Some may say, "Barry hasn't died and gone to heaven" although some might consider Vancouver Island BC to be in its midst. But you may view things differently when you consider that your tribute will coincide with their actual move to Canada. In fact, they're packed & waiting for close of escrow!
Please send in a few lines tonight or tomorrow at the latest. Your comments will be expedited by
using following ER email ad. 1editor@...
Thanks each of you your kind consideration these fine folks. Tnx too to ER Ed.
AM FOREVER!
david

From: k3hvg03
Topic: 2049  Message: 2049

OK, gents.. I got the first 2 tubes from Electon Valve, Memphis, TN. They are both NIB/NOS Tung Sol, JAN, mfg date 1962, original box, et al. The TV-7D min value is 34. One checked at 55, the other about 40. Both OK, although divergent in values. I'm sure they'll work OK, though. I've not received the 2 from Antique yet. If there's a rub I'll let everyone know. Both entities charge $34.95 for the tube. Not great, but better than re-engineering...maybe? de K3HVG

The following originally posted 2-5-01

"The 25AV5 TV tube works well as a substitute for the 6000. Same pin-out as the 6000 but don't just plug it straight in because the plate current will be too high. The screen circuit must be modified by replacing R120 (the original screen dropping resistor) with a 15K 10W unit and adding a 25K ww pot to ground. The screen is then fed from the arm on the pot which I mounted on a bracket behind the front panel. Adjusting the pot for 25 - 30 ma driver plate current gives 10-12 ma drive to the 4-400 on all bands.

I modified my Basic as above several years ago when 6000s were very hard to find, and have been using it regularly with the original 25AV5 in place ever since."

25AV5s go for about $7 last time I checked.

Mike,

Well, yes, I've heard reports of people using the 25AV5 successfully as a direct substitution, no mods. I tried this first and observed high plate currents on key-down (don't remember the exact figure but was concerned about plate diss). Also saw approx. 20ma of plate current continuing to flow on key-up. Results might not be the same for all rigs, I guess. Easiest thing to do is stick one in and see what happens. Unlikely to cause damage if test is kept short. I've been using my 'AV5 for about as long as you have.

73,

DD

# 2059. BC-610E Power plug

Yahoo group: T-368_BC-610
Date: 2004-07-28 21:32:58 UTC
From: Jack Taylor
Topic: 2059  Message: 2059

Does anyone have suggestions on where to obtain a 117VAC power plug that goes to the socket on the modulator deck? Is it recommended to swap out the existing power socket with a 3 prong grounded type? I have a 3 prong socket on hand but appears to be slightly smaller in diameter than the original.

Hi Jack and list,
That plug is available from Home Depot, Electrical area. I is yellow,
and
fits the connector perfectly. However if you receptacle has been banged
up
it might be tight, in which case you will need a fine grit sandpaper to
go
over the plug (yellow) to get it to fit the receptacle. I purchased
three
a little while back, used two they work fine and snug right up.

From: ab3l1@aol.com
Topic: 2062  Message: 2062

Hello all,

Is there anybody in the group that has gone thru the task to have screens made up for the T-3?

I have a friend that just became the owner of one in need of a redo. He has a source to have the screens made up but if they are already out there somewhere, no need for duplicates. Perhaps finding them in the East would be better because of the shipping weight on the three panels.

I could use mine redone as well. Any interest out there for getting them made up? His contact can make the screens in about three weeks time.

Let me know and I will pass on the results.

Thanks,

Bob AB3L

There's probably a lot of BC-610E models that could use a rescreening. In looking at my faded front panel, appears the panel may have been hand lettered at one time. Question in my mind is whether a new screen would print out crisply over wrinkle paint. I've started to re-wrinkle the cabinet but not really happy with the result. Maybe I'd be better off just to sand it back down and apply a smooth black coat. Comments?

Jack,

It's done all the time with the Collins A-line equipment. The outcome
depends on the screen person doing it.

Hi All,

You BC-610 owners back in the North East listen up, I have a great deal for you.

When I was doing net control duties for the CCA Sunday net Jim, K1QCF, checked in. He knew I had a couple of BC-610's and wanted to let me know he has an earlier open frame power transformer for a BC-610E and earlier BC-610 for free, you just have to pick it up.

He doesn't want it to go to the dump but will not ship it. It's pick up only near Barr Harbor, Main. Jim's phone number is 207-963-2949 and he is also good on QRZ.

I would love to have it myself as a spare for my BC-610E but too far to drive from Palmdale California to Barr Harbor, Main. So this is a great deal for any early BC-610 owner in the north east.

# 2072. AT-2 TUNER

Yahoo group: T-368_BC-610
Date: 2004-08-22 23:41:48 UTC
From: Norman & Barbara Ray
Topic: 2072  Message: 2072

I was lucky to take part in the "Classic Find" of a BC-610E which had been in storage for over 20 years and they wanted to free up some floor space. It had all the accessories. It had, in addition to the normal antenna tuning unit, a Hallicrafters AT-2 antenna tuning unit which the deceased previous owner had converted to an "L" circuit. Fortunately, he had not made any cosmetic changes to the outside.

I am interested in getting some documentation as to the original circuit etc. Any help in directing me to a source would be appreciated. It came with the original manuals....operating and maintenance but couldn't find reference to this unit..

I did some restoration which brings this "jewel" back to the condition I remember in the '50's in Korea.

Thanks for any help.

I've read and been told that the T-368 needs a "stiff" 30A circuit to run it properly. My "A" model is running quite well on a dedicated 15A circuit, with an 18A Variac set to 115 volts. All voltages appear "nominal" and the power out is about 400 watts. Prior to dropping the voltage down from about 123-125 volts to 115, the front panel around the filament pot would get quite hot. Now, at 115v, its warm but nothing like it was. The only untoward Am I just lucky?

+++++++++
I think so, but if it's a Federal Pacific breaker you could run the whole house on a 15 amp circuit and it wouldn't trip. As long as the wiring isn't getting hot it might work well enough. I sure hope you used 12 gauge wire instead of 14.

I always thought the Filament Pot would be the best place to put a cup holder, just to keep your drink warm.

Doran and Gents,

Am using a similar set up for my T-3 --- A GE 60 amp capacity Variac set to 115 volts...Operation of the T-3 is from a dedicated line that is used for a similar set up for a Viking 500 running at similar power levels, using a separate dedicated Variac. The two rigs are not used at the same time .. on the same line...but the line is a dedicated 120 vac line fused at 30 amps...I found that the T-3 would pop a 20 amp breaker at the om's place where I picked up the T-3...I don't know the voltage there....

So, I haven't noticed the temperature around the fil adjust pot...but note the pannel does get 'warm' not hot at the 115 volt level....

Not much new here... but might help u to know what happens at the Big KXR..

c u on 160 later this fall...

73,

Gene

From: James M. Walker
Topic: 2073  Message: 2076

Some time back, long ago, I experienced the high line voltage syndrome at its'
worse. I set out then to not have to deal with the weirdness for the Electric
provider. To that end I came across several high current variacs in the 240 VAC
and 130 VAC range, and purchased them. In the Big Iron arena here, if the unit
specs call for 220 VAC for the input that is what I now provide, and likewise for
those BAs that spec 115 VAC. It goes a long way towards peace of mind, and
the continued longevity of the equipment.

My T-368 and BC-610(I) both run through the 130 VAC system, with the metered
output to them set at 115 VAC. I also have installed separate variacs on the direct
input to the HV transformer in both cases, such that I can set the HV output to 2500
VDC independent of the main AC input to the transmitters. I read complaints a lot
that mention the heat of the "FIL" control on both front panels. Sadly the legend is
misleading, unless you read the manual. Which states, in an unmodified unit, as in the
AC input to the transformers are as wired from the factory, setting the filament voltage
to read 5.0 VAC on the filament meter, means that the Bias and other low voltage
supplies are set to the "correct" values as well.

As for front panel heat, with the use of variacs, now the most heat generated on the
front panel now is from the pilot lamps. FWIW.

In my experience the T-368 is very tolerant in regard to primary power requirements. I've run my Basic unit portable off an MG set where the line voltage varied between 125 key up to 110 volts key down and the rig still worked FB. In the matter of primary power characteristics, a "stiff" supply may require a 30 amp breaker in the wall box while a 20 A unit may be sufficient with a less well regulated circuit. This is because the momentary voltage drop experienced in the latter case will limit the key-down startup current surge. At a previous QTH my C and Basic models were located 5 ft from a 200 amp service and fed with #10 wire. In this situation a 20 amp breaker in the wall box wouldn't hold either T-368 and after installing a 30 A unit I would kick either or both breakers on the T-3's power supply about 10% of the time on key-down. Have not experienced this problem at my current location with a much longer feed to the shack even though the line voltage runs above 120 most of the time.

In the matter of front panel heating around the filament rheostat, lowering the line voltage would, of course, lower the temperature (lower Vsquared/R losses).

So, I would say you don't have anything to worry about, although a 15A circuit would seem to be pushing things a bit. Wonder just what the regulation on this line is and what kind of a momentary voltage sag you're getting through your variac and at the input to the transmitter on key-down?

# 2078. VFO's and the Beastly 610

Yahoo group: T-368_BC-610
Date: 2004-08-24 18:57:39 UTC
From: Alan
Topic: 2078  Message: 2078

Hi All,

I'm in the process of setting up my beastly 610. It's an F model that I had on the air about
4 years ago when I lived in Austin, Texas. Finally, I am able to find the time to put my shack together again.

I used to drive my '610 with the output of a DX-60/HG-10 combination. The DX-60 was running in the tune position, with the drive control cranked down. The output of the transmitter fed a piece of coax with a dual bannana plug on the end. The plug fit perfectly into the crystal socket on the tuning unit. I'd run it up high enough to get the recommended grid current to the 250TH. That seems like such a wasteful way to go, but as I recall the HG-10 did not have enough oomf to do the job alone.

This time around I would like to avoid using the DX-60. Would anyone care to share their experiences of alternate ways of driving a BC-610?

alancohn@... writes:

Hi All,

I'm in the process of setting up my beastly 610. It's an F model that I had
on the air about
4 years ago when I lived in Austin, Texas. Finally, I am able to find the
time to put my
shack together again.

I used to drive my '610 with the output of a DX-60/HG-10 combination. The
DX-60 was
running in the tune position, with the drive control cranked down. The
output of the
transmitter fed a piece of coax with a dual bannana plug on the end. The
plug fit
perfectly into the crystal socket on the tuning unit. I'd run it up high
enough to get the
recommended grid current to the 250TH. That seems like such a wasteful way
to go, but
as I recall the HG-10 did not have enough oomf to do the job alone.

This time around I would like to avoid using the DX-60. Would anyone care
to share their
experiences of alternate ways of driving a BC-610?

Alan Cohen
WA2DZL
Bloomfield, NJ

Alan,
Why not drive your Beastly 610 with one of the original tuning
units? Yes, I know they have a stability problem (until they warm up a good
hour or so), and then there's the combination 60 and 120 cycle AC hum that makes
you sound like 1961 vintage "Radio Moscow". I'm told it has something to do
with the resonance of the tuning units and the capacitances of the plate/mod
iron, but what the heck? That's how some seasoned ops know you're on a
"Beastly 610"!

I have a HT4-H/BC-610-I I run exclusively on AM, and use it as my high power
transmitter for 40 meters. Occasionally I run it on 75 and 160 meters as
well. The HT-5/BC-614 speech amp has been modified with fatter coupling caps,
and use a crystal head D-Ten-Four microphone with it. In spite of the minor mods
to the speech amp it still has the familiar hum from the tuning unit. (If I
operate crystal control the hum(s) are no longer there).

The original tuning units still turn up occasionally at Hamfests/swapmeets for reasonable prices, and they're easy to use. If you come across any why not give them a try? To me, it's all part of the unmistakable sound of a "Beastly". Just my opinion.

Mod-U-Later,

Joe Cro N3IBX

That's the rub, I think, with my lash-up. My original post had a few words chopped. What I meant to add was the fact that, with the 20 ft of #12 feed line, the Variac set to 115VAC, and the filament set to 5 volts, key down, the filament voltage drops to 4.9 volts. The power output on the Bird reads 390 watts. The scope looks clean and there's no noticable frequency perturbation, at all. However, given that the filament adjustment controls other voltages, I'm considering upping the un-keyed filament voltage to 5.1 and have it go nominal, key down. This increase in voltage would not appear to violate the admonishments in the Eimac "Care and Feeding" book, too awful much. So, as you say, looks good to go....

Loosen the coupler on the Veeder Root display (freq. display) and adjust
there.
You can do endpoint adjustments on the PTO, but it really not worth the
hassle for amateur use, unless you have a lot of time to kill and are
interested just for the technical expertise.

Now if you want to be really cool, install small light bulbs on the "shield"
over the Veeder Root display for backlight in low light conditions.

Having recently acquired a BC-610-C model for my K51 Chevy panel truck, I am in need of a the mounting bracket/isolator that holds the trans to the floor of the truck.

I know most of you have fixed mounting for the unit in the ham shack, so someone must have a set that he would part with to help with this worthy project.

Dale Gagnon: degagnon@... (KW1I) is working on putting the trans back together (came as pieces with some assy required...) while I am working on the truck. "Hopefully" the truck and genset and trailer for genset will be ready next year!

Keeping my fingers crossed...

You might have to build from a picture. Maybe you can
find an illustration somewhere, or maybe adapt the
same bracket from a T-368?

George,
If you have the BC-614/HT-5 speech amp with your BC-610; the mod
idling current should be adjusted to about 40-50ma on the meter, swinging up
to about 125-150 on peaks.

+++++++=
Hi George,

The drill on interlocks is to check the wiring at the blocks, it may be frayed and overheated. The springs may be crushed, the back of the decks may be bent and causing poor connections or performance.

If you've found none of that try filling the inside with Penetrox or some other product that electricians use on aluminum wire to inhibit oxidation.

My power supply deck was bent inward and required judicious use of a wooden mallet, several others were the victims of poor wire connections but they all work fine now. The poor wire connections were NOT easy to find either, I also had to drill two of them out to fit the wire better.

Steve, Larry, et al.

The BC-610-A through -D were used with the matching letter SCR-299 in the Chevy. The -E was used with the SCR-399/499-A.

It appears that after the War, the -E's soldier'd on. Some of the earlier models were transferred to the US Army Corps of Engineers stateside. I had a summer engineering job with the Corps in Arkansas in 1965 (installing Motorola Motracs and base stations). The Corps still had several B's and C's in service. I have often wished that I had kept up with where they went after that summer.

Joe and the Gang...

Glad to read the attached report...seems some hamfests are still doing moderately well...and some gear being traded among friends...

Went to Butler, Pa fest a couple of weeks ago...and was very surprised...the fall event is usually quite a good fest...or at least it used to be...this year my friend and I walked through the first three rows of tail gates...and then returned to our truck with some odds and ends to avoid carrying stuff...pound of solder...large ceramic insulators...some stock brass for lathe projects, a Tectroics RM-503 with a good CRT...ets...nothing special, but parts and pieces...when we dropped stuff off at the tuck we planned on doing the 'rest of the show'...and proceeded to what we thought was the next rows of goodies...that were mainly not visible from where we started, but where they have always been for the last ten years...

Well shock of shocks...nothing there...literally...just grass...we did in about two hours that was in the past an all morning and half the afternoon project to 'see it all''...very disappointing...but probably the worst of the trend in these parts that I've seen ... No boat anchors of the xmtr variety...a few rcvrs...and three NC-183Ds that were an 8 for condx. and ran abt 300 dollars asking price...

Those who were there, were the old standbys...but notable was the *total absence *of any Young would be Hams...it looked like a combination retirement community...and a good budies covention...

It has been a trend here in the NE Ohio area to see this decline in the Fests in the region.. No new young Hams...old geesers heading for Florida...and the 11 meter bunch...Not very exciting...

Fianally, I mentioned I bought a pound of real solder...yep...that stuff has got real lead in it too....the guy I bought if from was surprised I was interested and asked if I knew what is was...yep...that's what he asked me....he said I was the only one that day that knew what it was...and several who asked said they 'couldn't solder' and wouldn't because it was dangerous....several said they 'didn't know how..."

I wish I was making this up guys...I do have a HUGE imagination....but it is true as told to me....

73 to all ... and the T-368s here at the Big KXR in Ohio are alive and well...and soon will be on 160 as the summer shuts down and the travel stops for the winter...

Gene

# 2099. Speech amp for T3

Yahoo group: T-368_BC-610
Date: 2004-09-23 02:43:43 UTC
From: Jerry K
Topic: 2099  Message: 2099

Need some advice from T3 experienced persons:

If I wanted to use a high quality public address system amp in place of the stock speech amp, what's the best tried and true way to match it's low impedance output to the (I believe) 80K impedance of the 4-125A grids, and how much power would be required from the PA amp for full modulation plus some headroom?

Alternatively, the N9FOY homebrew speech amp for the T3 is mentioned many places, but I've been unable to find a working website with specific info/schematic for it. Any pointers?

Thanks,
Jerry W5KP

# 2100. TS-505 Manuals in PDF format available

Yahoo group: T-368_BC-610

Topic: 2100  Message: 2100

Group,

I still have the TS-505 VTVM manuals available to mail to anyone
whom asks for them.

They are zipped and are 711KB in size.

Holler if you need them!

From: k3hvg03
Topic: 2105  Message: 2105

Has anyone successfully substituted a 4-250A for the 4-400A final tube? What adjustments were necessary (voltages?) and were the results? I've got several spare 4-250's but no 4-400's.. Tnx

# 2106. Re: [T-368_BC-610] T-368 final amp sub

Yahoo group: T-368_BC-610
Date: 2004-10-05 14:48:10 UTC
From: James M. Walker
Topic: 2105  Message: 2106

With the exception of the maximum plate dissipation being 250 watts, as to 400 watts for the 4-400, the differences are minimal. While I was refurbing my T-368, I used the 4-250A during testing, and found no REAL difference between it and the NOS 4-400A I finally put in at the end of the test/refurbishing.

Maximum power output was the same for the plate voltage of 2400 VDC at 200 MA, produced 400+ watts output into 50 Load. I did not readjust any of the T-368
voltages, just popped the tube in and ran it. No problems. Did the same thing while
I was bringing my Thunderbolts back to life works OK.

# 2107. wtb 6000 tube

Yahoo group: T-368_BC-610
Date: 2004-10-17 14:14:08 UTC
From: n8lka
Topic: 2107  Message: 2107

I know this is a long shot,but Iam looking for the 6000 tube for the t368. I do know the 25av5 will work with a modification, but I thought I would try and see if I could find the 6000.The next thing Iam looking for the blower fan blade, this is the one that sets back by the power supply deck.The blower motor is good but at some point in time someone had the fan blade off the motor and bent it in the process.

Fair Radio has had the tubes from time to time, at a premium price. I think Antique Electronic Supply in AZ has also had them, and you might also want to check with http://www.elexs.com/

Good luck & 73; if you find a current source of them with low prices, please let the rest of us know.

The last time that came up it caused some
consternation at Fair Radio, they've since removed
that listing on their webpage since they no longer
have any of those tubes.

Hopefully they will find some more later.

Joe

> Width from side to edge of radius: Really no radius,
just brake it on a good brake.

The pocket is 4" deep with 7/16" flanges on the ends
but not on the bottom, the botom is bent back tightly
to the cabinet. The corners are cut deeply, actually
into the front panel a bit leaving a 1/4" gap when
the bends are completed. The top bolt hole is down
1/2", the rest of the hole locations you have.

Mine isn't that neatly done either. The 1/4" gap on
the corners is un-even. It looks like the brake was
old and worn as the bends aren't as sharp as they
should be for the thickness of the steel and they are
over-bent to make the holes line up. My father worked
for 48 years in the Acme Electric sheet metal shop, he
would have snickered at that one!

Give a yell if I missed anything,

Joe KG2CI

From: Mikhael Brown
Topic: 2117  Message: 2117

Hi,

I just recently got a PRC-104 and am ready to part with my PRC-74. I got it several years ago complete in the box with all the accessories and the accessory bag. It is still complete with the original operators manual and in excellent condition. It has one battery box which has 12 AHrs worth (4-3AH cells) of jell-cells and another new battery box still in the box unopenned. I also have the AC Power supply/Charger. It does work and has been on the air. I am asking $900 for the whole package. I prefer pickup as the Power supply/charger is heavy. Otherwise if you would like it shipped, the buyer needs to cover shipping from a professional shipping company. I live in the SF bay area and make trips to Oakhurst every few weeks and would be happy to meet somewhere along the way.

Let me know if there is any interest.

Date: 2004-11-07 22:48:16 UTC
From: Tom Mackie
Topic: 2119  Message: 2119

Does anyone have information on the MRC-56?
My neighbor has an enclosed aluminum trailer about the size of a jeep trailer. I noticed an insulator in the roof and he pointed me to a data plate identifying the trailer as an MRC-56 built for the Navy.

Unfortunately my neighbor sold the radios! I have a chance to buy the trailer but would like to know what radio set it carried.

# 2122. 24 + 12VDC Power supplies, inverters, 12 to 24V converter ...

Yahoo group: T-368_BC-610
Date: 2004-11-09 20:39:37 UTC
From: Ray
Topic: 2122  Message: 2122

I have a small pile of 24VDC power supplies that are very high quality,commercial grade,continuous duty,linear supplies by Newport Marine Electronics or similar. Definite not "Astron Grade" equipment.

In 24 V I have the following continuous duty units some NIB or shelf worn:
2 pcs 16A, 1 pc 20A, 1 pc 30A

In 12V similar to the above:
1pc 25A 1 pc 20A, 1 pc 8A 2 Pc 150W inverter

2pc Astron RS7A 1pc Astron 150W inverter.

These will all be listed up on e-bay in the next few days unless someone in the group wants to make an offer, cash or swap....
The power supplies, especially the 24V/30A are compact but definitely heavy.

+++++++
Seems to me that if ONE tube got weak you'd be having
noticeable distortion in your received audio. I would
further guess that low modulation would mean both
tubes were getting weak.

Topic: 2126  Message: 2130

Walter.

To begin with, have you measured the bias voltage being applied to the modulator grids at 50ma of resting plate current? Tube specs call for -96 volts with +2500 on the plates. In my Basic model the plate voltage is about 2800 and my bias setting for 50ma is -120 volts. You can make this reading by pulling the modulator drawer out just enough to get a probe on the terminals of the Modulator Bias rheostat. Bias voltage will be present with the transmitter on but NOT KEYED (to be safe leave the RH breaker on the PS drawer OFF). Normal reading with the bias knob turned fully counterclockwise should be around -200 volts, and -80 volts when turned fully clockwise.

If the bias voltage is in the -100 to -125 range and the modulation is OK as determined with a scope and/or on-the-air reports, your mod tubes are probably OK. If the end point voltages are way off (see above) you probably have some kind of trouble in the bias supply circuit. Check the string of resistors, two on each side of the bias rheostat. (Presume you have a manual to help locate these.)

If, on the other hand, the bias voltage for 50ma is significantly LESS than -100 volts, the problem could be soft tubes. Easiest way to check would be to stuff in a new pair and see what happens. Problem could also be in the modulator screen supply. No easy way to measure this, though. The screen voltage is derived through an 80K dropping resistor from the high voltage supply and is regulated at 600 volts by a string of VR tubes. Pulling the modulator chassis and checking the resistance of the large WW resistor (R11) mounted underneath the modulator tube sockets would be a start.

Good luck.

Dennis,

Thanks, as that's exactly what I was looking for. I wonder where you got the range of voltages, as I didn't find these when reviewing my manual.

I measure -88 to -215 volts full range on the modulator bias adjustment. The setting which gives me 50mA of plate current is around -92.5 volts.

At this point, the modulation on the scope looks fine. It's just that I'm almost at the endpoint of the bias adjustment knob. I may try some newer tubes to see if this has any impact, and also take a look at fixed resistors in the bias circuit.

Thanks for your help,
Walter - KK4DF

The overall adjustment range looks OK so your bias circuit probably is too.
The reading of 92.5 V for 50ma plate current is low, though, pointing to tube
or screen voltage problems. If you don't already have a spare set to try
out, 4-125s show up regularly on eBay.

You're right, the values we've been checking here don't show up in the
manual. Stuff I've jotted down over the course of 10 years keeping a pair of these
rigs on the air.

All.

Anyone know anything about a place called Seacoast Surplus? Put some stuff up on eBay a couple of years ago. No longer on the Bay, however, and their old e-mail address (SeacoastSurplus@...) doesn't work either.

Maybe a bit off topic but I thought I'd post here first.. Anyone need a fairly nice case for either a '312 or a '342. No dings, dents, or rust. Base clips work. Case is free to good home, only recoupment is box and postage. Also have a rather nice case for either an NC-183 or 183D (if you're not particular). It has an additional hole (plugged) on front. Its really nice and I'd hate to pitch it (I needed the guts). It was a toss-up to use this case or the original on my restoration. Again, free except for box and postage. Lemme know before it goes...!

I have restored a BC-610E and find that the modulation transformer has some shorted turns in the primary. One side is 100 ohms and the other side is 150 ohms and the audio demonstrates the problem. A Large RCA modulation transformer works okay even though there is a mismatch.

Any lurking out there? I may have a spare power transformer for the BC-610E for trade or will pay cash preferred.

I've resolved why I had to crank the modulator bias knob to about the 5:00 position which gave -92.5 volts of bias voltage. Now it's at about the 3:00 position with -105 volts of bias.

My modulator deck had a modification to the modulator screens, which I think was in Electric Radio #53. This mod left 600 volts on the V9 screen, but put 450 volts on the V10 screen. The purpose was apparently to lower the screen voltage of the negative going tube (V10), and hence allow the positive going tube (V9) to be driven harder giving a means for greater than 100% modulation. I've removed that mod for now, just to prove that this was what was causing my modulator bias to run out of room.

This now gets me back to more normal settings, but I can tell that I'm not getting quite the positive modulation as before. Whether I keep it this way or go back and re-install the mod is yet to be seen. But at least I know what was causing this anomoly for me.

Any of you T3 owners out there familiar with this mod, and have any postive or negative comments?

There are two types of Modulation transformers for the BC-610E rig! You would need to know if it is the open frame type or the "Square" enclosed type. One is black (open frame) and the other is grey. The open frame type
has bolts for the connections, and the closed case type has solder terminals.
Which do you need?

Actually, that happens not to be the case. BC-610-A through BC-610-E use an open-frame transformer, with all connections above the deck. BC-610-F and later, and variants of T-213/GRC-26 use hermetically sealed types with the terminals below the deck. The original transformer can in the BC-610-F is cylindrical with a square mounting flange. The ones in the -G, -H and -I and most but not all T-213 are square cross section with rounded corners. {It is not unusual to see the square transformer in a BC-610-F, in which case it is a replacement unit. A round transformer in a T-213 indicates that it was converted from an -F.} Neither variant of hermetically sealed type were ever authorised for the -E or earlier models as installation would require rather extensive (and irreversible) modifications to the modulator deck and associated wiring. To begin with, you have to cut a large square hole.

Sorry,
Not quite true! The BC-610(E) model that I currently use has grey transformers through out. They are in fact the "Square-ish" type and mount by way of feet drilled for 1/4 inch holes in the case of the modulation transformer, the HV transformer and the HV choke. The connections are solder points at the end of conical insulators. The leads, are HV cable 1/4 inch diameter and white with a green tracer line.

We are discussing the BC-610(E) and getting him the proper modulation transformer, to replace the bad one he currently has. I have a spare modulation transformer, it is however the "Open frame" type similar to the one used in the HT-4 (BC-610(E) model. Just trying to determine if that is the one he needs, if not no problem, if so let me know!
Thanks
Jim

# 2143. Re: [T-368_BC-610] Re: Modulator tube - low bias current

Yahoo group: T-368_BC-610
Date: 2004-11-22 15:07:02 UTC
From: James M. Walker
Topic: 2126  Message: 2143

Yet another case of the paperwork not traveling with the rig. Seen on an AM web-board:

For Sale: Genuine T-368 "Big Rig" AM/CW transmitter. Great audio, lots of power output for its age! Asking 1500.00

What that actually was:
1 T-368 case in fairly good condition, except for the three 2 inch diameter holes
drilled in the rear of the case. These holes were for various usages, such as the "out
built modulation transformer" which sat on a 4 foot square plywood shelf. There was a highly modified speech amp, (no documentation for changes) internal to the unit. The
4-125As had been replaced with 4-250As and the screen circuit was changed to them.
the final PA tube was also changed to a 4-250A and was powered by an external HV
power supply which was not part of the sale (he needed it). All of the interlocks had
been jumpered around by the simple expedient of large "wire-nuts". The 5933 was
removed and a cobbled solid state screen supply to the 4-250A was installed in the
PA side of the chassis. So much for "Genuine, Great Audio, and lots of Power output!

# 2144. Beastly 610 Modulation Transformers:

Yahoo group: T-368_BC-610
Date: 2004-11-22 15:48:15 UTC
From: yardleyite@aol.com
Topic: 2144  Message: 2144

Hello All,
Whilst on the subject of BC-610 modulation transformers, would anyone know the rated output for an early square one with the end bells? I acquired one for a spare in case the one in my HT4-H/BC-610-I crapped out (I've got the potted one in mine) and thought I could use it if necessary with a little drillage and blastage on the modulator chassis. Now I find out I'd have to jackhammer the chassis and wouldn't want to do that!

I figured it has to be good for at least 200W of class B audio but don't know for sure. I run my HT4-H conservatively, and get approx 280-300W output ( @... plate current) depending on the band it's on and where I set the loading link. I'd be curious what the mod transformer is rated at.

Off topic but of possible interest to the group, I modified my 2.0-2.5 tuning unit to work on 160 meters. It's relatively simple and only requires the addition of a few silver micas to pad the circut in the tuning unit to enable it to go down to 160M. You'll need a vacuum padder cap placed across the clips of C28 of either 50-55pf or 100pf depending on where at you want to go in the band in order to load it properly, but that's another subject. If anyone is interested in the tuning unit mods please email me offlist and I'll give them to you.

Have a Happy Thanksgiving and "Mod-U-Later",
Joe Cro

Jim,

Then it must be a post-war rebuild. All of the BC-610-E's that I have ever seen (plus I've owned four over the years) match all of the various manuals, all of which show the black open-frame type for the HV and modulation transformers. Terminals and wiring are above the deck. The other transformers, except for the HV rectifier filament transformer, have typical for the period rectangular sheet metal cases, with inverted (turned in) corners and the terminals go through the deck with all wiring below the deck. I've also owned two BC-610-F and three T-213/GRC-26, one of which was originally an -F and the other two we think were originally -G.

Anyway, the modulation transformer that he needs is the black open-frame one, unless his set had the same conversion done to it that yours had.

Are the HV wires you refer to in your set above the deck like the normal -E or below the deck like the -F and later? Also, are there any MWO stamps on the front near the BC-610-E nameplate? And is the overall exterior finish flat or semi-gloss black, or black wrinkle?

The HT-4 with military nameplates became BC-610-A, part of SCR-299-A, not BC-610-E, part of SCR-399-A and SCR-499-A.

# 2146. RE: BC-610E MODULATION XFMR

Yahoo group: T-368_BC-610
Date: 2004-11-22 16:23:44 UTC
From: Norman & Barbara Ray
Topic: 2146  Message: 2146

Thank you for all the discussion on the modulation transformer issue.

The BC-610E that I have is serial number 951. I took it down to bare chassis level and restored it. Both the power and modulation transformers are open frame units. There is no evidence of any other style mounting. Since the fungus spray and all were still very visible, I am sure they are the original ones. The modulation transformer has a split primary, one side which has some shorted turns.

Any help would be appreciated.

Norm W7LFA

# 2147. BC-610 TU47 Tuning Unit Modification to 160M:

Yahoo group: T-368_BC-610
Date: 2004-11-23 02:23:43 UTC
From: yardleyite@aol.com
Topic: 2147  Message: 2147

Hello All,
I've had quite a few requests on information on how to modify
the BC-610 TU47 (2.0-2.5) tuning unit to 160 meters. I've decided to email the
group rather than send out individual emails in case there are more requests.

Please find the following:

Pad: C31, C32, and C34 with 100pf silver-mica (postage stamp type) cap. This
will increase capacitance so you'll enable the TU47 to oscillate in the
entire 160 meter band. I don't know the entire freq range since I was only
interested in 1800KC-1999KC.

Regarding C28 Vacuum padding capacitor, I've found that if you plan on
operating from 1925KC-2000KC, the 50-55mfd cap will work very well. From 1800KC to
1925KC or so, you'll want to use a 100mfd vacuum cap for best resonance.
Remember,when you add a padding cap you'll change the "Q" of the circut, and may
have to touch up your antenna coupler if you use one. The above information
is valid if you're going into a 50 ohm load. For higher impeadance loads you
may have to experiment a little.

I set the loading link (the part # of the band unit escapes me, but it's the
one for 2.0-2.5) to about 5/8 total mesh for highest plate current reading.
It should dip to anywhere from 210-250ma or so. For some reason I get the
highest plate reading at dip and highest power output at the above setting.
Possibly it's reactance within the double balanced ATU I use. You may have to
experiment a little, but I think the above guidlines should get you on the top
band.

If anyone requests additional information please email me.

Best Regards and a very Happy Thanksgiving. Hope to work you on 160M!
Joe Cro N3IBX

# 2149. Y adaptor for PRC audio connector

Yahoo group: T-368_BC-610
Date: 2004-11-23 16:17:44 UTC
From: Mikhael Brown
Topic: 2149  Message: 2149

I am looking for a "Y" cable adaptor that will allow two audio connections to be made to the one on my PRC-104. My model has only one, the connector is for frequency control. I would like to use a headset and separate mic. I am sure there there has to be son out there. If not I guess will have to make one.

Thanks and 73's

Mike

# 2150. 165/g power meter

Yahoo group: T-368_BC-610
Date: 2004-11-25 13:50:23 UTC
From: n8lka
Topic: 2150  Message: 2150

I just got 165/g power meter that has been govt recon very nice shape,when I put it on power it reads fine, but when I put it on adjust, to get full scale meter reading,and then switch it to swr it reads full scale in the red. I know my swr is a 1.4. any ideas.

++++++++++
Yup, that's right, now, use the knob underneath the
meter to set it to the high end of the scale and
you'll be ready to take your VSWR reading.

# 2152. Re: [T-368_BC-610] 165/g power meter

Yahoo group: T-368_BC-610
Date: 2004-11-25 19:35:49 UTC
From: James M. Walker
Topic: 2150  Message: 2152

Hi Gary,
First thing is did you test the meter initially into a "real" 50 ohm load
preferably with suitable power handling capabilities?

Second is the output of the ME-165/G going directly to an antenna? By this
I mean is there and "Antenna Tuner, or Antenna Coupler" in line to the
load, either antenna or dummy load.

The normal setup, is coax out of the transmitter (source) into input of
ME-165, coax out of ME-165 to either an antenna cut to frequency, or an
antenna coupler/tuner, and then to antenna.

If you need the manual on the usage, I can email you one, which includes
a schematic of the unit.

Now, from your initial description, I would hazard a guess and say, if you
were able to use the set SWR switch position properly, then when you turn
the ME-165/G to the SWR position it read full scale, your output load
may not actually be what you think it is.

Also a caveat, Never switch the unit to the operate position with RF output
applied. You will eventually burn the contacts on the switch, and they
are NOT easy to find replacements.

I use one in my permanent station setup, and Also for my T-368 and BC-610
stations. A great aid for tuning up those units.

Gary,

Are you near a strong BC station? If so, you can get enough energy pickup to mess up the readings on these instruments. Quick check, turn the switch to SWR with the antenna connected and the transmitter OFF and see if you're getting a reading other than zero.

Just out of curiosity, has anyone tried the TL's in their '610 and if so,
how did they perform?
(As compared to the TH's) As I understand it, the "L" stands for low Mu and
the "H" is
for high Mu.

Doesn't it seem a little high for two finals at $250.00
from Fair though? I see 100THes and 250THes at hamfests
usually for a lot less than that.

I too have seen the TH versions for considerably less. Was hoping to draw out some
comments about the relative merits of lower amplification factor finals vs. the higher
as used in the BC-610. As a guess I'd speculate that the TL version would require
more drive to yield rated output power. If that's the case, would think the TL's would
be less desirable and hence command lower prices over the TH's in the market place.

You can see the difference here, Jack, by looking at the pdf files, for the 250TH vs the 250TL, to see the requirements.

You're basically correct, that a Low-mu triode requires more drive than a High-mu triode does, but as far as the prices are concerned, I'm not to sure that the difference between a TH and a TL is the factor. In fact, I'll come out say that a 250T(H/L) on all of the tube-reseller places on the internet are getting better than $200/per. There's some guy who's always got a 450TL for sale on ebay, claiming it's brand new, with a 'buy it now' price of $249.95 on it.

I lucked out, yesterday, and won two auctions for 250TH's on ebay... one is an HK version, and the other was a General Electric (JAN) VT-220 (250TH) and I got the both of 'em for around $50.oo, and that's what I would expect to pay for one, these days... between $25 and *maybe* $50, *IF* I could see the thing actually -working- in a circuit, first.

I've got a BC-610 E model here, and I've got a homebrew rig that uses (4) 250TH's (push-pull link coupled final, modulated by a pair), I know of 3 or 4 more BC-610's in the area, and a friend in the Houston area that has a final using a pair of 250TH's, modulated by (4) 813's in push-pull parallel, and that's just in the South Texas area, alone.

There's still a need for those tubes, but there's no need for the damn things to be $300 dollars a peice!

73 = Best Regards,
-Geoff/W5OMR

Not too long ago a 250TH was going for 190.00 each out of new jersey
now their listing says STOCK which means call for the latest quote.
Same with the 250TL bottle as well.

I use NOS Military Eimac 250THs in my BC-610s, and have found them to
still be excellent, and put out full power for the BC-610s in my possession.
YMMV

# 2164. Re: [T-368_BC-610] 250 TL's? or 304tl's

Yahoo group: T-368_BC-610
Date: 2004-11-29 22:30:42 UTC
From: w7kxb@comcast.net
Topic: 2164  Message: 2164

FYIW
At one time, the price of a 304TL was much lower than a 250th. After WW2 they sold for $0.25. West coast fishermen were using them for fish net floats (no kidding) sooooo, my friend converted his 610 to use a 304TL. I understand it worked fine. There isn't much of a market for 304's out there, except in amateur radio, and that's very thin, whereas the 250 market was also supported by some commercial users, which no doubt, is growing thin. I have see an ad on QRZ lately, asking $75.00 for 304TL's. Still too much IMHO. Guess it depends on how bad your needs are vs your wallet. At any rate, when my 250's need replacing, I will strongly consider converting over. By the way, the 304 might work well as replacement for the 100TH's. Just light up half of the filaments. (JAT)

Know as "Half Turn Tie Down Fasteners" when I was in military, used for strapping stuff to/thru canvas covers on APCs Tanks and Rocket Haulers. The other end had a recessed spring in the shaft that maintained adequate
pressure against these things so they didn't turn and drop out. They had other uses but that is the one I am familiar with.

Some have reported problems in navigating my site. There should be a vertical row of labeled buttons on the left side of the homepage that change color as you move your mouse over them, if they appear "broken", then you don't have Java enabled on your browser. You can either enable Java or use the new "Alternate link to photo page" that I have just added - it should be on the lower left side of the Homepage, just under where the missing page buttons should be.

I have just added links from the "photo page" to the rest or the site, so now everyone should be able to get around to all of the pages.

This is a problem with Microsoft Front Page using Java for the "hover buttons", as they are called.

Please let me know if this has helped out, I would appreciate it very much

The address is the same: http://webpages.atlanticbb.net/~w3np/

# 2178. BC-610 at Fair Radio

Yahoo group: T-368_BC-610
Date: 2004-12-13 22:13:47 UTC
From: Trevor Lewis
Topic: 2178  Message: 2178

for those of you who like the 610s, look what Fair Radio has (and some tuning units too):

scroll down in the folliwing link:
http://www.fairradio.com/Vintage.htm

BC-610H AM Transmitter from 1948 contract. Transmitter has not been run, but looks to be in very good condition. All tubes included, no plug in coils or plug in tuning units. This model has the newer sealed transformers similiar to those used in the T-368 transmitter. actual wt approx 400 lbs. Sh Wt 500 lbs.
#VL-BC610 $875.00
Pick Up price $825.00

[Non-text portions of this message have been removed]

# 2179. Re: [T-368_BC-610] BC-610 at Fair Radio

From: James M. Walker
Topic: 2178  Message: 2179

Seems a bit high, for a unit, that is untested, comes with no tuning units, and
no coils. Tuning units separately listed are 35.00 each, also unknown condx.
The good part is they knock 50.00 off if you pick it up there, but if you live
400 miles away it will cost you 60 -80.00 round trip, plus a stay overnight.

Can't tell if the rear cover is on it from the photo, some folks are keen on
having that, as a safety feature. Does the A.C. line cord and matching connector
come with it, if not add about another 25.00 to that.

Yep seems a "BIT" high! FWIW
Jim

They are a ring stamped out of sheetmetal big enough
to slide over the glass envelope of the tube and clamp
the air base to the deck by binding on two, I think,
8-32 threaded rods protruding upward from the deck
behind the tube sockets.

I almost think that those clamp to the top shoulder of
the glass envelope, that would make just about any
version of the 4-125 a model for the shape and size of
that hole.

No, they clamp down on the top of the tube envelope. The opening in the
middle has enough clearance to preclude any flashover from the plate cap.

Hello Doran,
I no longer have my manual on the T-368 but if memory serves me correctly, the tube clamps for the Modulators 4-125 Tubes, which have a very slight slope from the plate cap to the edge-side of the glass is about 1-1/5". I believe that I have some of these in our tube retainer ring bin, but will have to check later this evening when I return to work for the evening shift. I think that these are stainless steel with the securing holes as you described. I'll see if I have I have a 4-125 on display to verify the fit.

73,
Glen Galati

> models, but what was changed in the F version?
>

Tom,

Starting over.....

This question comes up a couple of times a year.  To the best of my recollection nobody has ever come up with official documentation covering the "F" model.

Changes from the E and earlier models are relatively minor, though. The F has a switch up on the RF chassis that provides the option of having the PTO run continuously or only when the transmitter is keyed. In early rigs the PTOs ran all the time, no option. Then, somewhere along the way, the PTOs always got keyed along with the rest of the xmitter circuits. Only the F had the switch as far as I know.

There was also a later mod to the 600 ohm audio input involving an added matching transformer. Kind of involved with the 600 ohm line coming in to the speech amp. chassis, then off again to the transformer mounted on the main modulator drawer chassis and then back into the speech amp again. Don't know for sure if this was unique to the "F" or not, though.

Hope this helps. You should be able to get along just fine with "E" documentation.

# 2193. Registries for the T-368 and BC-610

Yahoo group: T-368_BC-610
Date: 2004-12-25 03:21:33 UTC
From: redmenaced
Topic: 2193  Message: 2193

The list for the T-368's is in the "database" section of the homepage,
and shows 78 rigs. The list for the BC-610's is in the "files"
section and shows 32 rigs.

Joe

# 2194. MD-239A/GR anyone?

Yahoo group: T-368_BC-610
Date: 2004-12-25 06:41:34 UTC
From: Tom Norris
Topic: 2194  Message: 2194

Are there any FSK modulators around and for sale? Not that I can afford one right now, but thought I'd ask.

# 2195. Re: [T-368_BC-610] MD-239A/GR anyone?

Yahoo group: T-368_BC-610
Date: 2004-12-25 13:17:51 UTC
From: ELDIM
Topic: 2194  Message: 2195

Hello Tom,
I may have a couple FSK Modulators buried in the back.
These were used with the T-368 Series HFTransmitters.
My curosity on CHRISTMAS MORNING was stirred so I went digging.
I found one which is called:
MODULATOR, RADIO MD-239A/GR; SN: 21; Manufactured by ONEIDA ELECTRONICS; ORDER # 15498-PP-63. It is designed to mount on the top of the T-368 when configured for RTTY applications.
Now I'd better get my son's JBL Speakers Loaded and head for home. THen I've got some wrapping to do for my lovely XYL. I sure wish I could find a store open as I need some ricotta cheese for a cheese cake and some macaroon cookies for the base. MERRY CHRISTMAS TO ALL.

73,
Glen Galati, KA7BOJ
Tacoma, WA

Hi John
Sorry, The spare ones I have are 3-4, 6-8, and 8-12.

I have a TU-62, 1-1.5mc that I hope is capable of 160m for my 610.
Anyone know?

# 2205. WTB T3 or BC610

Yahoo group: T-368_BC-610
Date: 2005-01-28 16:45:12 UTC
From: skipperclan
Topic: 2205  Message: 2205

Hello all,

Looking to buy a T3 or BC610 for pickup in the upper midwest. I've owned two T-3's in the past (both listed in the regisistry by their current owners) and a BC610/T213 as well. Maybe I'll be smart enough to keep it this time. Doesn't have to be pretty, but I'd like one that's all there and working.

Thanks,

Ron W8ACR
Rugby, ND

# 2212. Registeria

Yahoo group: T-368_BC-610
Date: 2005-01-30 02:55:08 UTC
From: redmenaced
Topic: 2212  Message: 2212

The BC-610 Registry is here:

<http://f3.grp.yahoofs.com/v1/oD_8QeBOGTXOk5L5ESrejp-cllxWE5EdNTCHGrNpZLKhilAgyC_SCF7EfCCKSNJH5jRevZp5hpsN9WcSdG8/BC-610%20Registry>

The T-368 Registry is here:

<http://groups.yahoo.com/group/T-368_BC-610/database?method=reportRows&tbl=1>

I'm not sure what the best way is to update either one of them.

If anyone is confused about my involvement with this, I started this list and am the only moderator, there were two others but they've since declined the honor. Others can do the registries, it'll incite involvement.

FYI, this list has been up for almost 5.5 years and has 185 members.

I never know what to do with bouncing E-mail accounts, did they go on vacation, go SK, or if they are having trouble with their discount E-mail@... account, or if their ISP has installed new anti-SPAM filters to nab the latest crap from Nigeria. I give them several attempts to fix it then I boot them, there's nothing else I can do. So, if you find yourself mysteriously kicked off the list, #1 you wont' be reading this message, and #2 that is why it happened.

Glad I could make sense of that,

Joe

Need part number for mating "cord end" power connector
for T-368. Or would it be safer to simply replace both
cabinet and cord connectors with more modern Hubbell
connectors with grounds?

Tom

# 2215. T-3 and 610 Registry

Yahoo group: T-368_BC-610
Date: 2005-01-30 20:21:38 UTC
From: aa9wq
Topic: 2215  Message: 2215

I e-mailed Steve and asked him if I could mirror the info from the old list on my website. I have no way of editing the one that's there. If the moderator of the group wants he can put a link to the page on the data base page. I don't have access to it. I want people to send me a picture of them with there tranmitter(s) T-3's and 610's and I will do photos too a long with the rest of the information. We can make it a really neat page. Everyone let me know what you think and I will start working on this. It will take a week or so to pull it all together. The XYL's mom just pasted a way and we have that to deal with for the next few days. I will start on it shortly after that. If this is a go I want everyone to check all there info and let me know if anything needs updated ie: e-mail ect and what they would like to see on the page. Sounds like fun to me. I need your feed back.

Larry W9AMR
PS I am self employed so I have the time to do this.

++++++++
You might find the hole isn't big enough for that.

What I did was to use a 1-1/4" X 3/4" galvanized
reducing bushing and a 1-1/4" electrical locknut and
bushing to reduce the hole size so I could then use a
3/4" Kellem-style strain relief that would fit a 10/3
600 volt cord. I grounded the cord to the inside of
the cabinet/frame and used crimp butt splices to
connect to the hot and neutral power wires.

Copied below is the text from an announcement concerning a Military/Ham Radio special event that I think all of you will find interesting. Please check it out, and please try and participate. For more info please follow the link below.

Steve
KB4DMF

http://www.collinsclubs.com/carc/b-29/

The Collins Amateur Radio Club in cooperation with the Cedar Valley Amateur Radio Club will be operating W0CXX/29 to celebrate the 60th anniversary of the invasion of Iwo Jima. The special event will run from February 19, 2005 18:00 UTC to Feb 20, 02:00 UTC. Contacts will be made on an ART-13 and SCR-274N from a model of the B29 radio operator position. Special QSL. Freq(+/-): 3885 7290 14286 (AM) and 3529, 7029, and 14029 (CW). QSL with SASE to The History Center, 615 1st Ave. SE Cedar Rapids, IA 52401

The plan is to operate the ARC-5 mostly on phone (80) and the ART-13 mostly on CW (20), but we hope to be flexible and switch around, especially get the ART-13 on 80m AM after dark.

Clyde Hussey, a B-29 radio operator who was on the last B-29 mission over Japan, will be at the History Center at noon to inaugurate the B-29 station and make the very first calls.

I think it should be seen by all.

Find the Radio BN bunker! And the commo cooling device.

Caution, one bloody face.

# 2222. FOR SALE: Nice Condition 100% working T-368C for sale near Oklahoma City

Yahoo group: T-368_BC-610
Date: 2005-02-09 14:47:18 UTC
From: Jerry K
Topic: 2222  Message: 2222

Very good condition Crosley built T-368C transmitter, S/N 51. 100%+ modulation, full legal+ power out, new final, new modulators, stock speech amp recently replaced with new N9FOY-designed homebrew speech amp. Original stock military speech amp is included, as is a bound copy of the transmitter manual with details on the speech amp mod. No mods have been done to this rig beyond the speech amp replacement mod. Consistently excellent audio reports with the N9FOY speech amp. Read all about this transmitter and its new speech amp at www.w5kp.com. Be patient if you are on dialup, some of the photos are over 600K. External audio processing gear shown in some photos is NOT included at this price, but can be negotiated.

This T-368C weighs 700 lb. and runs fine on 120VAC 20A power. You pick up (15 mi SW of Oklahoma City), or I will deliver free in the OKC area. I will also deliver or meet you within 200 miles of OKC for a reasonable fuel fee and some unloading help. Drawers are removable, two people easily can handle load/unload. The transmitter sits on permanently installed heavy duty casters for easy handling. $1400 firm, PayPal, cash, or bank check. Please contact me OFF LIST via email regarding this equipment.

Tks/73,
Jerry W5KP

Dennis -

That is the same design I use in my T-368F. It is a modification of an old RCA design. It is the one using a pair of 2E26s, with feedback around the 4-125s. Worked well for me. I know it has been a while since you heard it, but, I built it around 1990 or so. I believe N9FOY' name is Steve. He used to be very active on the high end of 160. I actually cannibalized a regular T-368 speech amp and used it as a foundation. I cut off the top of the chassis, built the speech amp on a blank but same size aluminum plate, and aluminum soldered the plate onto the chassis. This way I was able to use the same connector that was on the speech amp. 73 - Mike

# 2226. RE: [T-368_BC-610] FOR SALE:  Nice Condition 100% working T-368C for sale near Oklahoma City

Yahoo group: T-368_BC-610
Date: 2005-02-13 02:41:31 UTC
From: Jerry K
Topic: 2223  Message: 2226

I hope I haven't misled anyone. I never meant to imply that the N9FOY amp was "new" in the literal sense of the word. I meant that I recently built this one, so it was new to me, and it does work incredibly well in my T-368C. Compared to the complexity and effort required to build some of the elaborate homebrew speech amps I've seen proposed for the T3, this one is ridiculously simple and easy to build, yet works great. I remain convinced that a hefty amount of negative feedback via the ladder arrangement is the key to it's great performance. This might be a fine example of the KISS principle. My hat is off to Steve Konopka, N9FOY, for an elegant and simple design. If any T3 owner is interested in building one, you can see my website at www.w5kp.com for info and some photos of my particular installation. Schematics and design notes are also posted in the AM Window's Tech section.

From: troy-aero@att.net
Topic: 2228  Message: 2228

I have a few left over T-368 parts for sale. They are all from the Fair Radio cannablization/tragety years ago. I have posted pictures of them on my web. Go to //home.att.net/~troy-aero. There are two tank circuit switch sets, a Jennings cap, and the mechanical drive unit which interfaces the two vacuum caps. I would like $75 for the tank/switch unit. I would also like to sell the other tank/switch unit, the vacuum cap, and the drive unit as a set for $225. If that doesn't wind up to become popular I will split later. Thanks, Tim

# 2229. PRC-74B for sale

Yahoo group: T-368_BC-610
Date: 2005-02-28 17:30:02 UTC
From: Mikhael Brown
Topic: 2229  Message: 2229

Hi,

I got a PRC-104 a while back and am ready to
part with my PRC-74B. I got it several years ago
complete in the box with all the accessories
(antennas, backet, mic, key, ect) and the
accessory bag. It is still complete with the
original operators manual and in excellent
condition. It has one battery box which has 12 AHrs
worth (4-3AH cells) of jell-cells and another new
battery box still in the box unopenned. I also have
the AC Power supply/Charger. It does work and has
been on the air. I am asking $900 for the whole
package. I prefer pickup as the Power
supply/charger is heavy. Otherwise if you would
like it shipped, the buyer needs to cover shipping
from a professional shipping company. I live in the
SF bay area and make trips to Oakhurst (east of Fresno) every few
weeks and would be happy to meet somewhere along the
way.

Let me know if there is any interest.

From: pentode01
Topic: 2230  Message: 2230

If anyone is interested, I have silk screens for BC-610I front panel.
I was considering making arrangements for lending them out but am
uncertain of how they will be treated. I bead blasted the front
panel, etch primed and black crinkle painted, then silk screened
using a very durable epoxy paint that did no bleeding at all. Looks
great. If anyone is interested, I would make the screens available
for $75 if they are returned cleaned and in good condition. A $200
deposit would be required upfront, in case the screens are damaged.
I am on Long Island, NY 11743.

Bob,

$125-$225 depending upon cosmetic and mechanical condition and whether or not they include the two fixed vacuum capacitors. The last three I sold went for $150, $150 and $125 but the first was part of a nearly complete SCR-499 and I juggled all the prices in arriving at a set price, the second was part of another deal with a T-213 and BC-614-I, and the third was seven and a half years ago. So start at $175 and work one way or the other. :-)

They seem to vary widely based on condition, geography, relative urgency on the part of buyer &seller, etc. I bought one 12 years ago, complete and clean, for $25 (this was before the more recent/ broader revival of interest in big heavy iron) 2-3 years ago I mentioned here on this list that I had another one for sale that was complete and in unusually nice shape except for one big but fix-able dent in one side of the cabinet cover. No one expressed any interest at all at the time, and then someone later bought it, considerably later, for $75. I knew I wasn't getting top dollar, but had reasonable confidence it was going to someone who wasn't going to gut it for parts (as has happened to a lot of these units), so that influenced my decision to sell at that time for that price. That's a long-winded way of saying not to grind the seller down too aggressively on price, but also that the seller may not have a lot of other people in a bidding war....

Bienvinidos, Pedro!

in the early morning hours, there is AM activity on 3.885, mostly in the Southern US Region at
around 4:30 or 5am. Please come join in. You should have no problem hearing WA5CMI,
W5OD, W5SUM or KB5YA, all in Texas, except for W5SUM in Shreveport, LA.

Y, yo vida en San Antonio, Tejas.
perro, yo es en New Orleans, oreta, con mucho travajo.

Mi espanol es bueno para un juedo...
es no bueno por nada, para un mexicano, so I do the best I can :-)

Que paso, Pedro!

Su Ingles es bueno, nuestro Espanol,..... enh.

The radios look PERFECT! Nice project for the hot
summer spent in the airconditioned shop.

Now, Pedro, here's the challenge! What is the surplus
situation in Mexico? Are there any good stores that
sell this stuff? Does the Mexican gov't sell their
old radios to the civilians? Are there any R-390's,
R-390A's or T-368's in civilian hands down there? Do
you have a good supply of tubes for these radios?

What are you using in your station?

Joe KG2CI

From: Dave and Merrijoy
Topic: 2243  Message: 2243

FYI...there's a BC-610H at Fair Radio in Lima, Ohio. Looks quite nice judging from the picture on their website.

+++++++++
What I meant was that none have been surplussed since
'92, the ones in private hands came out before that.
I SAW piles of them at Seneca Army Depot and Griffiss
AFB waiting to be crushed! They never came up for
sale to us, the usual buyers at those auctions, we
were waiting for them!

I HAVE one of the last two tht Fair Radio sold.

My R-390A came from the Syracuse Naval Reserve Station
and was sold at the Griffiss AFB DRMO auction,
probably one of the last ones sold that wasn't trashed
at the St. Julien's Creek Massacre. It was stored
inside and came with METERS!

That should set that straight,

Joe

# 2246. BC-610E MODULATION TRANSFORMER

Yahoo group: T-368_BC-610
Date: 2005-03-19 19:59:21 UTC
From: Norman & Barbara Ray
Topic: 2137  Message: 2246

My BC-610E restoration is complete and ready to go
but......shorted modulation transformer. I sent out an "SOS" a few months
ago and I thought I had one lined up but I guess they decided to keep it.
In any event, if there is one out there that is not needed I would
appreciate buying it. The "E" model uses the open frame transformer with
the terminals out each end.

If someone has a spare they feel comfortable parting with it would be
greatly appreciated.

I really enjoyed the restoration and am proud of the finished
product....another historical item back among the living.

Norm W7LFA

From: Jerry K
Topic: 2248  Message: 2250

I presume you are talking about 1N2637's. You could stick them into a T3 without further modification, but I can't imagine why you'd want to. Although it must have happened somewhere, sometime, I personally have never seen a 3B28 fail, and I first started working with them in 1961 in Navy radar equipment. I have never heard of one failing in a T3. Solid state HV rectifiers are not recommended in many transmitters because of the instant HV they give (no ramp-up time), but in a T3 with the 25-second HV delay that shouldn't be a factor. Most people want to solid-state a HV supply to get rid of some filament load on an overworked PS transformer (not a problem with T3's), or to reduce heat in a small, crowded cabinet (again not a factor), or to get rid of troublesome 866A mercury vapor tubes, such as in the EFJ Valiant. To replace 3B28's with 1N2637's in a T3 seems to me like hauling coal to Newcastle. I'd sell them to some Valiant or Collins owner instead.

73, Jerry W5KP

# 2253. Loose wire in BC-610 E

Yahoo group: T-368_BC-610
Date: 2005-03-31 03:45:33 UTC
From: John King
Topic: 2253  Message: 2253

Sorry about my post that didn't have a text. I have a loose wire dangling in my BC 610 E.

The loose wire has a ring terminal on its loose end and comes from under the modulator deck through a grommet to the top of the modulator deck. the wire is black from the ring terminal to the laced bundle it is in.

The bundle comes through modulator deck between T 7, T8 and L2 and L3. All of the other wires in the bundle appear to go to the relay on top of the modulator chassis. I believe that the wire is the only thing keeping me from firing it up.

If I can provide additional information, just let me know. Please look at your BC 610 E and see if you can spot the wire I am asking about. Your help will be greatly appreciated. thanks and 73, John, K5PGW

Hi Gents,

1) I am a T-368 E , owner and have a question. I have modified the preamp and get very clean audio from it, but am having problems getting good lows and Hi's after the grids of the 4-125's.

I am thinking that the problem is the Mod Transformer. Has anyone run into this problem ?

2) Also, it is off topic , but I am lookong to buy a GPT 750, if anyone has knowledge of one F/S please contact me offline.

Thats a good one! Pure hen's teeth these days. Unobtanium , etc.

Can you believe that these were available at scrap prices in the West & mountain states in the 70's.

Oh! the stories I have heard from 5 land operators and points west.

The only one I have ever seen cost the guy $2K and was a heap.

I would consider trading BOTH of my GPT1Ks for a GPT 750.

Well.... Maybe only one.

Military Radio Collectors Group - 2005 Meeting
Official website: http://www.syzen.com/milradio/
---

The tenth annual meeting of the Military Radio Collectors Group will be held at the NCO Club, Camp San Luis Obispo, California, May 6 to May 7, 2005. Events will formally begin at 0700 Friday morning, but early arrivals are welcome on Thursday afternoon, May 5. Registration will be open at 1800 Thursday evening. Those planning to attend should contact Lynn Fielding at lynn@... or (310) 533 – 8627.

THOSE ATTENDING MUST SHOW AUTOMOBILE REGISTRATION, PROOF OF INSURANCE AND IDENTIFICATION AT THE FRONT GATE!  For more information and registration forms go to:
http://www.calguard.ca.gov/cslo/Veh_Pass_rules.htm

Secured areas for equipment operation and display will be available inside the Club and there is ample room on the surrounding grounds and the campground to accommodate outdoor activities. Suggested operating frequencies during the meet are 3870 kHz, 3885 kHz and 7293 kHz for AM, 3996 kHz and 7296 kHz for USB, and 29.6 MHz and 51.0 MHz for FM. The use of 146.52 is recommended for simplex operation.

Friday Program
---
Friday will be devoted to equipment setup and display, operating events, technical presentations, equipment judging and informal gatherings in and around the campground. Special activities will include fox hunts on six M, (51.0 MHz), and 3885 kHz.

Saturday Program
---
The equipment exchange will be held from 0730 – 1100 on Saturday morning with a barbecue (advance sign up required) following at noon.  The business meeting will convene at 1300.  Event clean up will commence at 1500.

Presentations
---
Robert Burger, WB6VMI Topic: The GPT 10K Transmitter
Bart Rowlett, WB6HQK Topic: Evolution of the Field Telegraph, 1903 – 1965
Ludwell Sibley, KB2EVN Topic: The "Gibson Girl" Lifeboat Radio
Bill Feldmann, N6PY Topic: Restoring the Hallicrafters SX-28
Receiver

A time schedule will be provided at registration.  Anyone else interested in providing a presentation, demonstration, or field exercise should contact Dennis DuVall at W7QHO@... or (818) 240 – 7907.

Food and Drink
---
Coffee and tea will be available during the event for a donation of 50 cents per cup.  Bottled water and soft drinks will be available for 75 cents each. Continental breakfast items and juice will be available on Friday and Saturday mornings for 50 cents each.  Lunch on Friday, dinner on Friday, and a lunch on Saturday will be available with advance sign up.

Lunch Friday - Barbecue Tri Tip Sandwich, baked beans, cole slaw, and dessert by Wild Bill's Barbecue.  Approximate cost $11.00

Dinner Friday - Appetizers, Chinese Chicken Salad, Antipasto Salad, Green Salad, and dessert.  Approximate cost $8.00

Lunch Saturday - On Site grilled Barbecue Beef, Chicken, assorted side dishes, and dessert.  Approximate cost $10.00

Those planning to attend and those wanting to participate in the on site meal options should reply by April 18, Contact Lynn Fielding at lynn@..., or leave a voice mail at (310) 533- 8627

The bar in the club may be officially open during certain periods and drinks may be purchased at those times. THE CONSUMPTION OF ALCOHOL IN THE CLUB OR ON THE SURROUNDING GROUNDS AT ALL OTHER TIMES IS PROHIBITED!

Video & T-Shirt
---
Bob Heusser, K6TUY, plans to record the event this year.  A T-shirt for the tenth annual meeting of the Military Radio Collectors Group will also be available.

Accommodations
---
Tent and car camping facilities are available on-site adjacent to the NCO Club.  Full RV hookup are available for $14 and electricity and water only are available for $12 per night.  Billeting is available at the camp on a space available basis for $21 per person per night.  Hookup and billeting reservations can be made by calling (805) 594 - 6500.

Finances
---
There are no admission charges for this event, but a fair share contribution of $10.00 is requested from each participant to cover costs.

Directions
---
Camp San Luis Obispo is five miles west of the city of San Luis Obispo. From the 101, take highway 1 west toward Morro Bay. Turn south (left) from Highway 1 to enter at the main gate.  The NCO Club and the campground are on the west side of the camp.  Direction signs will be posted along the route from the main gate to the NCO Club.

Points of Contact
---

Topic: 2258  Message: 2259

Norm,

It has been quiet. Seems to still be working OK, though.

I checked on the modulation transformer but although I have a plate transformer for an E, the only modulation transformer I have is F. Which as you say is significantly different.

From: k3hvg03
Topic: 2260  Message: 2260

I've found out the difficult way that all T-368 mechanical parts are not the same nor interchangable. I'd been looking for a back panel for my "A" model for about a year when Fair Radio came up with an acceptable one, found "out back". I got it and refinished it, complete with a nice replacement blower and filter elements. It really looks really nice.. matching paint, the works. Hmmmm.. something's not right? Turns out, back panels are not all the same. The fasteners on the top, bottom, and the one in the middle aligned up perfectly. The problem is, the "A" model has 7 side fasteners, the panel from Fair had only 6. Oh well.. I popped out the errant side fasteners and hung the panel, anyway. Quoting from the "Battle of Britain"..: "We'll bloody go with what we've got!" and it does keep the riff-raff out.

Not only that but somewhere along the line they put
two holes in the top side to hang the panel from while
fastening the first Dzus screws.

I think it was after the "D" model.

OK, I'll chime in. I have an RF ammeter from a BC939...which I want to to use in a homebrew antenna tuner. Any suggestions how to test the beast? Just put it in series with some modest (100W) RF power and see if it reacts? The meter seems to stick in certain positions, but when tapped, the needle moves (then sticks) at another position. But I have the sense it's OK.

And if OK, I'd like to locate a second (matching) unit so I can have one meter in each leg of a balanced feedline to measure antenna currents.

Your thoughts, group?

Thanks for the few leads on the BC-610E modulation transformer. Nothing yet but patience will pay off I am sure.

We need to save these parts......found a power supply deck for I believe the post BC-610E era with the sub chassis terminals. The previous owner was going to "deep six" it. Not for mine but someone will need them sometime.

# 2270. T-368 Modulator Bias setting

Yahoo group: T-368_BC-610
Date: 2005-06-03 03:35:05 UTC
From: paul03034
Topic: 2270  Message: 2270

Hi,
I got a T-368 and am checking it out(never been in another hams hands). Only thing done to it by me is the bypass of the filters and clipper tube on the audio sub-assy. If I set the switch to Mod Bias x20 and and set the bias to 50Ma (half way between 0 and 5 on the excitation meter)the modulator tubes will start to glow red, so I can't set according to manual. Am I missing the boat here? Meter scale at 5 would be 5x20=100Ma because switch says x20 for the multiplier on the excitation meter. Changed the two 4-125A tubes that were dated 1959 and same deal. Modulation does not seem clean until I bring bias up about 2 lines on meter which would equal 20Ma Bias.
Max power out is 300W with 225Ma plate current (PA Seems Soft). Modulation is downward about 25-50 watts probably at over 100% modulation applied.
Any thoughts or suggestions would be appreciated and thank you in advance of any help.

Paul

Ola Paul,
First I would need to know which model T-368 you're using, then I would say that if you followed the manual which manual do you have?

The Military way to tune it assuming it isn't modified is to set the modulator bias to 40 - 50 MA, with the transmitter in AM mode and the tune operate switch in operate, then with no audio set the modulator plate current to 40 - 50 MA and leave it. If your 4-125s are glowing then they are being driven hard, (not a good sign) even with no signal.

The setting for the modulator isn't finicky (in my experience) if things are running per the manual. Did you check the underside of the modulator deck for broken or missing components as per the manuals for the unit?

More info, need more info, OVER!

From: Steve & Jeannie Keith
Topic: 2272  Message: 2272

Does anyone have or know of anyone who had a Chevrolet
K51 Panel truck from WW2 that originally housed the SCR-299?

I am presently restoring mine and I seem to have a lot of extra
holes on the outside walls. I am trying to figure out whcih ones
should be there and which ones I should fill in. It sure is a lit easier
while I am doing the initial stripping of the truck.

Thanks
Steve AKA Dr Deuce

Paul,

Sounds to me like you're actually pulling somewhat more modulator current than what your meter is indicating. At 50ma total plate current, the bias voltage on the 4-125s should be -175 V (approx.). Set it at this value and see what current the meter is then indicating and what the plates are doing (i.e., glowing or dark). No convenient test point for doing this so you'll have to run a lead out the back of the cabinet (appears you have already taken the back off and by-passed the interlock circuit). Recommend reading the bias voltage at the wiper of the "Modulator Bias" pot, R25.

BTW, at 225 ma with a good tube you should be getting 400+ watts of carrier out.

Hope this helps.

Hey Dennis,
Don't let the "power cops" hear you say that, they all swear a T-368
won't put out 450 watts. Oh, they of little faith and knowledge!

Carry on though, it is good to see some activity on this list.

Heads up to any T3 owner who may need info on this mod. This is the simplest, easiest to build, and most importantly the best working speech amp setup I've seen anywhere for the T3. My website, www.w5kp.com, has detailed info and some photos of how I integrated it (and the feedback ladder for it) into my particular T-368C. However, I'll be permanently taking down the website in a few days. So if you want this info, grab it now, last chance! Thanks.

73, Jerry W5KP

Hey Joe,
How are you doing. Hear you on from time to time on 80 meters. Yes I
load
my T-368 for maximum efficiency and then have to turn the variac to the
HV transformer down a tad so as to not get any harassment.
73 there buddy!

What does it matter, if it's into a dummy load, or into an active
antenna, as long as you're not exceeding
1,500W PEP output?

Lots of people seem to be under the misconeption that there's a carrier
limit of 375w while running AM.

T'ain't true!

Want an interesting read?

Hello everyone.
With W5KP's blessing I have posted the N9FOY mods on my web site including awesome pictures of Jerry's workmanship. Thank you Jerry! If you haven't seen it yet check it out when you have the time. If anyone has anymore info to add please let me know. I will add it to the site.

I am also working on the new T-368 registery. I want to make a really informative registery site. If you would like to add a picture of you and your T-368 or just your transmitter please send it to me with an update of any changed information. Lets make this registery up to date! I know a few have change hands. The new web address is: www.w9amr.com/n9foy Let everyone know where it is.

Hello everybody

I have the T-368 registry page up and running on my web site. If there is any out of date or wrong information that you know of please let me know. Please E-mail me any updates or additions to the list. If anyone has a web page or a picture that they would like to have added just let me know.

If you give me your information when you click on the call sign it will take you to your web page if you click on the model it will show a picture of your transmitter (and of you if you prefer). I just need the information from you. If you do not have a web page I will Post your transmitter information with your picture. the registry URL is www.w9amr.com\t-3reg E-mail me at larry@... Let me know what you think.

I will do the BC-610 registry next.

Thanks

Larry W9AMR

It works for me directly from the email. I just double click the link below. Of course you have to be using rich text format.

I'll bet that http://www.w9amr.com\t-3reg/index.htm

will work better.

Group,

My T-368 C suddenly started throwing the High Voltage Breaker, the Main Power Breaker, or Both upon Un-Keying. It will play key down, AM mode, with or with out modulation 24/7, not problem, no over current, arching, etc. Un-Key it, and WHAM...usually the high voltage breaker, but sometimes the Main or even Both let go. I figure it must be something in the timing sequence. Maybe time delay circuit has failed. Any ideas?

Evening...

Had the same problem here with my T-3 some years ago... turned out to be
not bad but failing, 3B28 rectifiers... got hold of a truly new set and the
problem went away...

Ola Gang,
I would check the 3B28s one or both may be going south. The time delay relay is for the warm-up time for the 3B28s which generally don't need it but it saves the tubes, if it fails open there won't be any HV, if closed you probably wouldn't notice unless you physically checked the device.

I had a peculiar problem with the insulator ring around the plate meter it somehow started collecting moisture and the coating fell away in spots
when the thing was damp it would intermittently short for no reason in RF out mode or in standby didn't make any difference.

Just some thoughts.

Guys - what time delay relay does the '368 use?
I have a box of time delay relays here that are no use to me, and would like to pass some
along to someone who can use them. I don' currently own a BC610 or a T368 but love
reading everyone's discussion on this list.

From: Mikhael Brown
Topic: 2293  Message: 2293

Hello,

I have a PRC-74 whip antenna to use with my PRC-104 but the label that tells what frequency the taps are for is missing. Can someone tell me what taps are for what frequency ranges on the antenna?

Thanks and 73's

Mike

No unkey time delay at the antenna changeover relay shorts the HV to ground. You need hang time on this relay. Doug

I have to ask...

"shorts the HV to ground"

where and what kind of high voltage are you referring to and where is it
shorted to ground?

That time delay protects the antenna change over relay and keeps the tank
circuit loaded as it flywheels down, possibly preventing flash over from
excess rf voltage but nothing more... also useful for semi-break-in on cw...

From: Tom Norris
Topic: 2298  Message: 2298

Subject pretty much says it all. I've got a couple here new in the box, they're a solid state plug in replacement for the 866/3B28. Just curious if anyone has had any experience good or bad.

If they're bad news, I could always offer them to the Collins Collector folk$.

# 2301. Re: [T-368_BC-610] T-368 Breakers

Yahoo group: T-368_BC-610
Date: 2005-06-28 07:56:46 UTC
From: r391
Topic: 2288  Message: 2301

Evening Doug...

Think your compensating for another problem... I can set my relay for no time delay and nothing bad happens...

That said there is a problem on some but not all of the T-3's with the tank arcing over to the chassis at this point...

http://mysite.verizon.net/vze4brdx/DSCF0013.JPG

due to mistuning, sudden antenna problems or modulating the rig to 100% or a combination... but only if you have b+ on your tank and it arcs over will it pop the breaker as the power supply will dump through the rf induced arc... you might also loose your plate meter too... anyway, that well known electrically weak area is easily fixed with nylon screws and some insulating rubber sheet... if your having any kind of flash over no matter what is initiating it, that electrically narrow pinch point is the place to check and stabilize... mine was done before first power up so I never had an arcing problem to begin with... in any operating condition...

Back to the question at hand which I also did have at one point... the breaker would trip while going into transmit or to receive... this occurred after many trouble free hours... didn't realize it the first moment that it happened but my 3B28's were apparently going south... changed em out as the easiest and cheapest 1st thing to do and the problem was gone...

73, Ott

Tom,

Have been using them for over 5 years in my T3. No problems what so ever. They were actually in mine when I found it. never bothered to change them back to 3B's. Only problem, they are an ugly green color rather than the traditional black. Since my T3 runs" NAAKED" (no covers, don't ask, long story but sure is nice to peep around the corner and see the 4-125's and the 4-400 (glass chimney) all lit up) they just don't look right. Started to change them back to 3B28's just for the ambience. Guess I will spray paint one day. YMMV.

Hello,

I tried them in my T3 after a 3B28 failed. About 50% of the time the HV breaker would trip upon keyup. I never tried to diagnose the problem, I just pulled them and replaced the 3B28's which have soldiered on for the past few years.

Well, the glow from the 3B28s is very low and pointed down
so not much coming from that area. The heat is a nice touch
in the basement in the winter though!

Did that show up using a tube tester? Is a tube

tester any help here?

Excellent picture! I like the repair on the spring contact in the bottom right corner of the picture, I'm going to see if I can get some of those reproduced. I remember you telling me that a bad connection there would produce squealing on transmit.

BUT, to the woodshed with you Mr. I see those nasty corrosion spots on the chassis where the parts bolted on should have a solid ground connection.

Oh, I guess it probably has a ground through the bolt/nut/lockwasher but,.....

Joe

# 2310. Re: 610 registry missing transmitters...

Yahoo group: T-368_BC-610
Date: 2005-07-04 04:44:33 UTC
From: aa9wq
Topic: 2310  Message: 2310

I have had a few e-mails wondering why there transmitters are not on the list.

This is a copy of the old list. If I missed any please resend me the info and I will add it. It was hard to work with the old list. Down load it and you will see what I mean. It's under files on the reflectors mail page. Plus I am not sure how up to date that one was. It's the only one I had to start with. Sorry about the over site. I will keep this one up to date. Everyone just needs to keep me informed. I will keep both the T-3 and the 610's as up to date as I can with everyone's help. Please send me any changes that need to be made and any new transmitters or missing ones that need added. I would love to see the lists grow!! I know there are a lot more of these that aren't on the list. If you talk to a fellow owner ask them if that are on the list and if they aren't have them send the info to me if they want to be a part of the list. I can even post the additions here on the reflector if it's ok with the moderator.

Larry W9AMR The proud owner of 2 T-368 and a BC-610.

Is there any interest in starting a R-390-390a registry? Or is there one I don't know about? If there is interest I will start one. I have 2 A's and 1 non A to start the list with.

Larry W9AMR.

# 2313. RE: [T-368_BC-610] R-390's

Yahoo group: T-368_BC-610
Date: 2005-07-05 14:57:18 UTC
From: Mike Feher
Topic: 2312  Message: 2313

I think there are way too many R390*s to make the list worth it for a long time. I have been given and given away more of them for free than any other receiver. It seems there are too many T-368s also. I only had one BC-610 and I sold it so cheap, I, may as well given it away. A local ham is making good use of it. I think one of the best lists is the one for the Hallicrafters FPM-200s maintained by W8ZR. I may be biased, but, regardless, considering only about 200 were made, most of them re-called, so, not many are around. To me that item deserves a list. If for no other reason is that when I crap out they will be not be thrashed. There are others that deserve the same attention and distinction, but, I will not go there. So, while I am repeating myself, the R-390 series does not deserve that notoriety, yet. Maybe in 50 or more years. 73 - Mike

# 2314. Re: [T-368_BC-610] R-390's

Yahoo group: T-368_BC-610
Date: 2005-07-05 16:03:09 UTC
From: Todd, KA1KAQ
Topic: 2312  Message: 2314

I agree with Mike (particularly the 'or more' part), and would ask - just how would such a registry be kept? Considering that the vast majority of these things are depot dogs, one person may have, for example, R-390A with EAC tag #546 on its panel, yet someone else may have the A with EAC #546 stamped on the back of the frame in ink. Who then has EAC #546? (* see below) What about the 'new' tags that can have any number you ask for stamped on them? And what about the separate modules with correct manufacturer and contract numbers? I mean, these things are really important to registry folk. Would it then end up being nothing more than a brag list? "Bill has one R-390 and three A models, Joe has one R-390, two As, and one R-391" or similar?

This is silly of course, but IMO so is the idea of running a registry for any high-production radio, especially one you can't track by some perceived pedigree. Or for that matter, anything beyond the unusual or rare/scarce. The real purpose for such a registry should be to serve as a means of tracking historically how many of a certain example exist, as well as offering a means for their keepers to contact each other with problems, solutions, and so on. There are already a multitude of mil-type reflectors for questions and help, specifically 2 or more for the R-390 family of receivers alone, and countless web pages supported by experts; real or otherwise.

I think Don Reaves is keeping a list of the much more scarce R-389 LF version, not sure if anyone is tracking the R-391. Two examples of where a registry could indeed help owners pass information to and fro as they resurrect these beasts.

I'm still waiting to see the first tag that reads "R-390/non-A" myself. Now, there's a registry just screaming to be made. And think of the epay possibilities.... (o:

Without a doubt, the R-390 family is right in the running for the 'best of the best' list. Enjoy it for what it is, as well as for what it is not.

de Todd/'Boomer' KA1KAQ

* Example: Collins KW-1, the production of which consists of a mere 150 examples and 2 prototypes, has *two* entries for #34 (only one has been verified). Obviously one is being misread by its owner, but if it can happen in such a small group, how would anyone manage a list in the potential tens of thousands with swapped out/missing tags?

Hee hee. If I had a bunch of repro nameplates, I'd stamp one of them "non-A"
and see how long it took a visitor to spot it. :-)

Seriously, though, "non-A" came into use because of the well known laziness
or sloppiness or whatever of most posters. There aren't that many R-390/URR's
compared to the bzillions of R-390A/URR's but nine times out of ten, someone
saying something about the latter just says or types "R-390", "R390" or just
"390". So when someone needs something for the former, they correctly make sure
to specify which model it really is. There are too many differences between
the two, starting with they don't even align the same way.

From: aa9wq
Topic: 2316  Message: 2316

I know this is off the subject of 610-T-3's but it has stirred some activity on the reflector. My apologies to the moderator.

I have got e-mails and posting both positive and negative about a R-390 registry. Most negatives are that it's not practical. If I was worried about being practical about anything to do with this hobby I would not have most of the stuff I have in my shack and in my shop. I know there are a ton of 390's. Just thought it would be cool to watch the list grow. I will hold off on the ideal of a R-390 registry for the moment. Maybe later some time in the future I'll bring it up again.

Larry W9AMR

PS. Next time someone giving away r-390's, 610, t-3's I'll take a few :) I'll make more room in the shack!

There is the boatanchors group, I'll have to look up
information for that, but there already is a very active'
R-390 Group --

http://mailman.qth.net/mailman/listinfo/r-390

There have been a several attempts on Yahoo, but they
all seemed to have died horrible deaths. The R-390
yahoo group has over 300 members but hasn't had a
post since 1999, there is also an R-390 Swap list which
has 26 memberss an 9 posting since 2001, then there
is the R-388 list with 20 members with a handful of
posts since it was created in 2003.

There is also an R-390A registry, though it shows numbers
of units per contract- as reported to him - and not individual
radios.

There are a couple folks that sell repro tags, but
the demand for phony tags is probably not as high.
A phony tag would be easy to do -- scan a real tag,
play with the text in Photoshop or what have you,
then print using whateverytheheck method is used
for PC boards - but apply it to the back of your tag.
One way it's a real radio, flip it over and it's a 390
non A, or an Interrocitor, or whatever you want it to
be.

Tom,

Good Lord! I didn't mean I was going to offer them for sale!!! I have thought, though, about having some T-3/FRT tags made and offering them to typing impaired T-368 owners. :-)

No no, I meant doing it *just for fun* and making them
one at a time like the lazy was of masking pc boards,
(print layout from QEX or what have you, iron the just
printed image onto blank board - ) just for when folks
come by the shack.

Just for *your own* amusement.

Sounds like we're building our own ebonics-type radio vocabulary here?
If so, we can just dispense with most of it and make tags that say
"BIG RADIO, GRAY/HEAVY/CONFUSING". This can only help the non-cause.
The guys out there with engraving machines could make a ton of money
updating things like SX-28s to say 'SX-28 non-A", too.

As far as the T-368 goes, just chop the tags right after the number 3.
Use the remainder for some rare 68/FRT radios on ebay. You gots ta be
ready for the trendy folks. BC-610s could get messy.

I can hear Hank tooling up now....

Dave and anyone else who is wondering -

Not sure how you missed this part before, but here's a repost, FYI:

>There are already a
multitude of mil-type reflectors for questions and help, specifically
2 or more for the R-390 family of receivers alone, and countless web
pages supported by experts; real or otherwise.

Granted, I did not post specific links (I like to think that folks are
at least a bit resourceful and internet-savvy), but there is probably
more info available online for the R-390 family of receivers than any
other one. By simply using that weird Google thingy and typing in:

R-390 mailing list

I got the following two hits right at the top:

mailman.qth.net/mailman/listinfo/r-390

Larry, I was more curious to know how you would go about creating a "registry" with radios that have no real way to be tracked or registered accurately other than by number surviving/current owner. It really has nothing to do with practicality, at least not in the same sense as having old stuff in your shop or shack - that is (of course) completely practical, if not considered sensible by those who dislike old gear. As one of my old math teachers used to say, "apples vs. oranges".

In another post I've reposted part of my comments more specific to lists, pages, etc with suggestions as to how to look for info with an internet search engine. Hopefully this will clarify things more. I see that Tom Marcotte has posted his information page, which is probably the most well-researched and extensive explanation of the models, manufacturers, and approximate numbers produced. He and Les Locklear have been in the business (okay, 'hobby' really) of collecting information and sharing it with the rest of us, for many years now.

If you really want a registry-type of challenge, try to collect and format information for all of the existing 'original' or completely matching units still in existence. There are a few that didn't go through the military or its depot-servicing (where defective modules were replaced with working modules, regardless of manufacturer; tags were swapped, etc). Find those with all modules matching, front tags matching the s/n stamped on rear in ink (not all have these, but what the hell) and so on. I suspect it will be a very small list, but also a very challenging one to assemble. I know of several folks who have or had units in this group, they do exist. Make sure to get shots of all modules and tags to confirm.

Of course, keeping track of where they are or when they change hands could be tricky. At the very least, it will keep you busy.

> Larry W9AMR
>
> PS. Next time someone giving away r-390's, 610, t-3's I'll take a

> few :) I'll make more room in the shack!

I got my R-390/URR for free, one of those 'if you can carry it away, you can have it' deals, got another one in a trade which ended up going to George Rancourt (one of the OT R-390 guys who truly knows his stuff), several R-390As in deals from $100 to $200. They do exist, one just needs to be resourceful and not automatically default to the path of online convenience. Online works fine, it's just more expensive.

Then of course, there was the *free* T-368 that one of the guys had given to him 2-3 years back. Like-new condition, stored in the garage of a house being sold, the owner was about to scrap it. 2 of us helped the new owner move it from one side of the state to the other. I still drool whenever I think about it.

Excuse me while I go wipe off the keyboard....

Mike, and T-3 Gang,

I've not been closely following the R-390X situation recently...have
been occupied with many other projects around the shack here at the
W8KXR Super Station, so please excuse me if I'm a bit out of date...

But, ur question seems to imply there is no active R-390x reflector
activity, or at least one that is functioning as an active forum for
R-390x operation and their care and rehabilitation...at one time there
was such a reflector and a very excellent one at that...but...like many
things it more or less ran its course and died a politically muddled
death...

Let me know if I am really out of date re the R-390x story...?

I have a stable of --390x's along with two T-368s...and would be curious
about the current situation...

# 2335. Hallicrafters R-274/FRR FS

Yahoo group: T-368_BC-610
Date: 2005-07-14 14:27:41 UTC
From: Mikhael Brown
Topic: 2335  Message: 2335

Hello,

I have a Hallicrafters R-274/FRR (SX-73) which I am offering for sale to the group. It is in very good condition with the original Hallicrafters cabinet. It is in working condition only missing 2 of the screws that hold the reciever in the cabinet.
The Hallicrafters SX-73 (R-274) communications receiver was manufactured from 1952 to 1954 for the military-commercial market. It covers 0.54-54 MHz in six bands, AM/CW.
A copy of the manual can be found on this site, if you want more technical info on the receiver, http://bama.edebris.com/manuals/military-kg7bz/r274/
I can get digital photos for anyone interested.
I am asking $750 plus shipping. I will deliver in San Jose, Ca or Fresno, Ca areas.

Mike

Well I'm lining up the work for a long cold winter and I am planning on a lot of help from the group! First I have my T-368 that need to do just a little work on ( new speech amp), second is the rebuild of the Chicago Electronics 20A that I just purchased and it need work, and third is the design and construction of the 160 - 10 meter VFO utilizing the Collins 70E-8A.

That ought to take me into spring don't you think?

Wellll,
First off the item description, seems to indicate, that the unit HAS been
modified. Next the connectors are SO-239s and that means it has been changed
as well. I would say this seller is NOT familiar with the unit or he would
know that.

As for the description, unmodified ME-165/G units DO NOT monitor power out
all the time. The manual and schematic verify that at a glance.

Lastly the price is prohibitive in the buy it now column, See fair radio
for a more realistic price for depot refurbed units.

I just bought three on the E-bay place, separately and most of them were
less than 45.00. Seems you could wait for another bargain to come along.

Oh and the manual is on my web page under Military radios.
As always YMMV

Strange anomalies occuring in San Antonio...

On a recent trip back to San Antonio from New Orleans, I stopped in at my buddy WA5BXO/John's place, in Spring, TX, and picked up some personal stuff that was there. One of the items was my Sure SM-7 microphone. I was anxious to plug the balanced audio output of the mic, back into the 31-band Graphic equalizer, feed the balanced output into my balanced-input, highly modified Bogen PA system that's being used at a speech-amp and get on the air with some 'big' audio.

All was great. Audio sounded fabulous, reports were glowing with praise and the positive/negative peak ratio was pushing 4:1 on the 'scope. Good thing I'm only running 100w of carrier output on the rig, eh? Anymore, and a 4:1 ratio would mean I was running more than 1,500w PEP. (www.qsl.net/wa5bxo/asyam/aam3.html)

Anyway - all was great. I was up early (3:am or so) and was on 3.885 calling "CQ 75m Fone". No answer. Did some more testing, adjusting, tweaking and even tried the big Western Electric Ribbon microphone (there's three inputs, and a JT-30 is on #3 input, the EQ output is on #2) but input #1 on the Bogen has a problem so, I just turned it down, and didn't bother with the big mic. Problem is probably a bum 6EU7.

Then, along around 3:47am the phone rings...

A sleepy-sounding gal asks "did someone call me from this number?" CallerID had her placed South of town - I could tell by the prefix) and I said, "sorry - we don't call people at 4am, unless there's an emergency, and there's nothing going on, here..." "ok, thank you".

I hung up, went back to working on the audio, again. Got in a QSO around 5am and all was great. Signals were up, conditions were good, reports were glowing.

Around 7:15am, there was a *tap* *tap* *tap* on the shack door. I thought "huh? Who would be here at 7:15am, on a Sunday morning?"

When I got to the door, there was a big ol' COP out there. Now, when I say big, I'm 6'3" and 260, and this guy was head and shoulders taller than I am!

He asks: "is everything ok, here?"
I looked at him, kinda incredulously... "yeah, all's fine. Why? What's the matter?"
He says: "We recieved a Nine one one call, from this residence."

I immediately assure him that there's nothing wrong, and I say 'hang on a sec" and go back to check on my aged mother, who's laying in her bed, sounding like she's sawing Big Redwood trees into kindling. She's fine and I go back to the cop and say "man, everything here is fine. Do you know who called?"
He says the call was placed -from- the residence. I ask him "what time?" He calls the dispatcher and she says that the call came in at 7:05am - they showed up at 7:15am.

When they (there's two, by now) are satisfied that all is great, he says "you're a radio operator?" peering over my shoulder, looking at the rig and all
(http://w5omr.shacknet.nu/~w5omr/hamstuff/My%20Junque/hamshack-1July2005/2005-07-08/100_0061.JPG)
and I invite him in. I go on to tell him about all the neat things that Hams, in general, do; how we're able to talk to the Space shuttle (since it's up there, right now and is a current event topic); all the emergency communications; how hams were the first responders to the September 11th disaster; how when there's no power or electricity from a flood, hurricane, earthquake, or other natural disasters that Hams are the first ones on the scene, provind communications with emergecy power, portable antennas etc... and then go on to explain about my affliction with old-tyme radios and how I *could* spend upwards of $10,000 dollars for a commercially built radio, but that I could build one myself that does basically the same thing, because when you boil it all down, all you need to be able to do, is talk to the person on the other end, and hear him talking back to you, and building something that works from parts, instills a lot of pride, and that there were other people who shared the same interest. I compared it to driving a kit-car (that you build) as opposed to picking one up off the showroom floor. The analogy was good, because it worked.

The nice police officer agreed that it was a neat thing, he was impressed with it all, thanked me for my time, and he and his partner went on about other more serious (I'm sure) affairs.

In the mean time, I'm wondering "what in the world is going on with this damn rig?" and the first thing I do, is install a low-pass filter on the output of the rig (that I -thought- was in-line, but wasn't). I don't think it makes much difference, but it's there anyway and I'm still in a quandry.

So, when I'm faced with an electronic puzzlement, especially RF related, I call my friend/mentor/AM Elmer, John/WA5BXO.

He goes on to tell me about how he, Otis and Candy/K5IYW, back in the old days, had an Elvis style, Sure 55S microphone (which now houses the dual condensor mic elements with 4 LED's in a picture John had up here in the Reflector yesterday) that had just the slightest RF feedback in it... not enough to hear, but enough to go through the rig, and it was because of the magnetic pick-up in the mic. Perhaps John will weigh in here and straighten that story out (I hope so, anyway). He said, that

because of the feed-back, there were parasitics and birdies up and down the band, around ever 20kc or so, from the fundamental frequency.

I guess it's all possible. I've heard my dad tell tales about how his BC-610 had the metal grills in an oven in a house that was two doors down, 'talking'. The grill was apparently resonat with the carrier frequency, and you could hear the audio on the carrier. She was a little embarrassed about it, because she heard his voice in her oven, when she came out of the shower, the first time. Dad 'tweaked' the grill a little, took it out of resonance, and the problem never came back.

The thing that has me puzzled most, is that somehow the rig had to take the phone off the hook, THEN dial out. The switch is a mechanical device.

(insert Twilight
Zone music, here)

It had to be dialing random numbers. I had never seen the number/name of the person that called at 3:347am.
I wonder if there were any long distance numbers dialed? ;-)

Come to think of it, I had disconnected and put back on a shelf, the big Western Electric Ribbon mic, AFTER the police showed up. It certainly has a big horse-shoe magnet in it, but that input was at minimum, because it doesn't work.

Curiouser and Curiouser

Such is life here, at W5OMR

Any ideas/thoughts/comments?

Nah, all that had to happen is to generate the tones
on the out-going line, past your phone. It was up to
the phone company equipment to make sense out of it
all, and it did what it could, it dialed random
numbers.

FOR SALE:
FT171B Crystals for BC610 Transmitters etc.

160m AM:
1885, 1900, 1915, 1925, 1930, 1945 kHz
1970, 1985, kHz

75m AM:
3825, 3830, 3837, 3855, 3870, 3875 kHz
3880, 3885, 3890, 3905, 3950, 3955, 3983 kHz

40m AM:
7123, 7143, 7146, 7159 (one left), 7252.5 kHz
7255, 7260, 7280, 7285, 7290, 7293, 7295 kHz

20m AM:
7143 and 14286 kHz

Some CW frequencies avaiable too. See web site.

Available for $12.00 each - only on frequencies listed.

**********
**********
Bob,
Probably modulating the aether on 1885KC,3870-3890KC, and 7290-7295KC
on AM, of course!
Mod-U-Later,
Joe Cro N3IBX

PS: Had my HT4-H/BC-610-I/HT5-G on 3880 and T-368-E on 1885KC last night.
Band conditions were "in the bucket", but was still able to put a signal
out.....

If anyone wants these QTY 41 crystals for their SCR522 or ARC3
radio, I will probably take any offer, no matter how low!
I will also take trades of parts, tubes, radios or accessories
or other radio paraphernalia that are excess to your own needs!

Let's swap / share the goodies!

# 2370. BC-610E Questions

Yahoo group: T-368_BC-610
Date: 2005-10-21 16:10:25 UTC
From: Todd, KA1KAQ
Topic: 2370  Message: 2370

Greetings, apologies in advance for duplicate posts -

I'm the new keeper of a Hallicrafters BC-610-E that followed me home Wednesday night. It has a few mods done to it, like an audio mod from a newer military rig wired in to replace the missing BC-614-E, antenna connections replaced with RG-8 to an outboard filter & relay, and replacement meters added in place of two originals.

Now, I'm not too terribly concerned with making it look brandy-new, but I would like to clean it up a bit and get it back closer to its original configuration. Years ago I picked up a BC-939 antenna tuner in hopes of someday finding a 610, and fortunately the mounting studs were still in place, just flipped over. I'd like to know from the collective wisdom about the BC-614-E outboard speech amplifier, how available they are and if it's worth trying to use one. I'm one of those guys who doesn't mind doing reversible mods like tube subs, component changes and such, I'm just not big on drilling and blasting. The audio circuit currently installed might work fine, but it's a rat's nest of wiring and has nothing holding the module in place, it's free to flop around if the transmitter is moved. While I realize these transmitters were quite common on the surplus market for years and modified to the taste and needs of the user, I'm not in a position now where I need to have parts dangling by wires inside simply to make it work.

I'd also like to hear from folks who own, use, or have used these beasts. In particular, I'm interested in the tuning procedure since I got no documentation with the unit. The plan is to power it up over the weekend for initial tests and check out, but I don't want to fry anything. It appears to have all the original iron, the only noticable change being 3B28s subbed for the 866s, which I'm okay with leaving.

Also, if anyone has or knows of a source of reasonably priced 2A3s, I broke one while removing it for transport, when it came loose and smacked into the corner of the added audio module (cleverly hiding out of view). I do have tubes to trade, from 813 to 811A to 807 or whatever else is in the garage. There is one available for testing purposes, but the box is marked as 'weak', so it's not a long-term solution. Singles, pairs, whatever works.

Looking forward to any stories, suggestions, or other related information.

Thank you -

de Todd/'Boomer' KA1KAQ

Topic: 2370  Message: 2371

I have a mint condition TM11-826 which covers BC-610-E, -F, -G, -H, -I,
and T-213/GRC-26 and Antenna Tuning Units BC-939-A and -B dated October
1952.
I have been considering putting it up on eBay along with the similar
manual for the T-368 (TM 11-809-35 December 1958)
since I don't expect that I will ever actually own one or the other.
More reluctant to sell the T-368 manual.... see my webpages at
http://sjcook.com/army
Anybody want to make me a good offer for one or both? (Both mint condition)
--
My MOS was 32C20 - Fixed Station Tansmitter Repair. (Aug66-Feb68)
We had quite a few T-368's in VietNam, but the camp down the road
(B-52?) had at least one BC-610. I have no idea where they got it since
they hadn't been issued in many years.
That was the smallest transmitter we studied in signal school, and the
largest actually encountered in the field.
I was stationed at the 5th Special Forces Signal Maintenance Shop in Nha
Trang.
I remember one day that two guys came walking in carying a main power
transformer from a BC-610... slung on ropes from a pole carried between
them... like a dead tiger or something. They were wanting to do a bit
of horse trading. I am sure we did not really want it, but probably
traded them something anyway.

Todd,

Go to WB2FCN's website:

http://eshop1.chem.buffalo.edu

You can get info on the BC-610s, the manuals in PDF format, and you can ask Jim a load of questions.

He restored my FIRST one from a garage deal. It needed quite a bit of cleaning.

One cautionary note: These do NOT work with multi-band antennas that have TRAPS or CHOKES.

IF you use the BC-939, it is intended for either a single wire out the back either of 44ft or 77 ft. Some settings REQUIRE some high volt vaccuum caps. These may or may not be easy to find.

EACH band requires its own tuning unit AND PA loading coil.

I'm not sure as to BC-614 availabilities, BUT Jim can fill you in on a direct audio feed into the mod chassis.

2A3s are out there - just NOT cheap.

Bob - N0DGN Owner of two BEASTS!

# 2373. Re: [T-368_BC-610] BC-610E Questions

Yahoo group: T-368_BC-610
Date: 2005-10-21 19:09:50 UTC
From: wa5cab@cs.com
Topic: 2370  Message: 2373

In the SCR-399, the BC-939-A or -B was used mainly to match a 15' (or at a halt a 24') whip mounted on an MP-47 which mounted through the roof of the HO-17 Shelter. The two vacuum capacitors supplied for the BC-939 (12 or 15 uuf and 50 or 55 uuf) are rated 20KV. They are almost identical to and easily mixed up with the two supplied with the BC-610 and T-213/GRC-26 but the ones used in the transmitter are rated 32KV.

The BC-939 will also match the wire antennas Bob mentions but probably more commonly used with SCR-499 (no truck or shelter). Later SCR-499's were supplied with dipole antenna kits and the BC-939 was not used with them.

# 2374. BC-610 terminating impedance

Yahoo group: T-368_BC-610
Date: 2005-10-28 17:26:44 UTC
From: Rbethman
Topic: 2374  Message: 2374

The standard connection from the porcelain insulated connections to the BC-939 is INDEED 50 ohm coaxial cable.

Those desiring to ELIMINATE TVI issues would NORMALLY install a Low-Pass filter in-line between the BC-610 and the BC-939 which is already internally wired with 50 ohm coaxial cable.

I also place the ME-165G in-line PRIOR to the BC-939 or the proper dipole. My BC-610 location does not allow for a "wire" exiting from the BC-939 to the outside. So it is coax to the outside.

I ALSO own a T-213, an overhauled BC-610 by depot, in August 1959. One of the changes from BC-610 to T-213, was to remove the porcelain insulators and replace ONE with an SO-239. I can find NO internal final circuit mods other than this, and the schematics agree with this assessment.

As Geoff/W5MOR has indicated from his operations, I TOO have had ONE and ONLY one gripe about getting into a CHEAP "portable" telephone since 2000. I provided the individual with the necessary information to contact the phone company to have a filter put in place. He has NOT returned or complained again.

There is NO question that the output of the BC-610 series, my first one happens to be an (I) model, is indeed 50 ohms impedance. It is unfortunate that some hams make the ASSUMPTION that since it has porcelain insulators for the output, that it is a balanced output of OTHER than 50 ohms.

I cannot stress the importance of obtaining the manual, carefully studying it, and pay close attention to the details. The ME-165G is unquestionably a 50 ohm input SWR/Wattmeter/dummy load. It comes with "N" connectors for input and output.

Don is ABSOLUTELY correct!

The use of 44ft and 77ft "wires, AND the use of the "term" long wire, is the military's AND the manufacturer's. If you are going to use a dipole do NOT use the BC-939! It's intent was for the specified wire lengths and/or the issued whip antenna.

Of course I have not pursued a whip installation. It would seem to be a useless endeavor as the 160, 80, 40, and 20 meter bands are "normally" of horizontal polarization. I see no logic in operating in cross polarization, and making communications more difficult than necessary.

Very good and confirmimg information. I guess I'll keep my TAC-1!!!
And... speaking of TAC-1's, has anyone else got/seen a TAC-1 with a
metal instruction plate affixed to the top of it that explains use with
the BC-610..... like mine does??

Bob & Group,

As originally issued, the BC-610-A through -E had plug-in final amplifier tank coils with fixed links. Conversion kits were issued during the war that included the rotary link tank coils. Those issued for SCR-299 also included tuning units above 8 MC (originally the upper limit of the SCR-299-A through -D). Some of the kits, including one for SCR-399-A and SCR-499-A (BC-610-E), came with a doublet (dipole) antenna which eventually (post-war) became AN/GRA-4. The 1.0-2.0 MC kits also included a doublet.

The BC-939-A originally came with a 3-terminal feed-through insulator on the side for input. It and the earlier BC-729 were connected to the BC-610-(*) with a short length of shielded cable.

The ME-165/G was built for the T-368/GRT, which was set up for coaxial cable from the git-go.

But anyway, the output impedance of a BC-610 depends on the number of turns in the output coupling link on the plug-in final amplifier plate tank coil, not whether it has the original ceramic feed-through posts or not.

# 2377. Re: [T-368_BC-610] BC-610 terminating impedance

Yahoo group: T-368_BC-610
Date: 2005-10-29 16:45:16 UTC
From: Rbethman
Topic: 2374  Message: 2377

Robert & others,

Both, my BC-610(I) AND my T-213 have had the porcelain insulators replaced with an SO-239. Upon loading into the ME-165G, my SWR into the 50 ohm dummy load "barely" flickers the needle off the stop on reflected, it at all.

Both of the transmitters came with movable link coils. The only coils I have that DON'T have movable links are the 160 meter ones.

In testing the ME-165G with an antenna impedance test bridge shows it indeed to be 50 ohm impedance.

With all this in consideration, I must therefore conclude that the output of BOTH transmitters to be 50 ohm output.

The 3 terminal input insulators on the side of the BC-939 are misleading. Internal inspection reveals one terminal to be for a ground connection. The other two are wired internally with 50 ohm coaxial cable. The reason for the space between those two terminals is the plate voltage issue. In the CW position, the plate voltage is 2500VDC. In AM, the plate voltage is 2000VDC. were it NOT for the spacing of the terminals, there would be constant issues with possible arcing - ESPECIALLY while you are tuning the BC-939 to the tuning tables/cards.

There are also TWO different models of the BC-939. There is an A model and a B model. I haven't noted any obvious differences, but there apparently are some somewhere.

>

I understand that. There was an MWO replacing the two ceramic insulators with an SO-239. And part of the conversion of BC-610-F , -G, -H and -I's to T-213/GRC-26 was the same change. I was just pointing out that none of the BC-610 models originally came that way.

> Both of the transmitters came with movable link coils. The only coils I
> have that DON'T have movable links are the 160 meter ones.
>

I suspect that most of the fixed-link coils have been discarded by hams over the years. The 1.5-2.0 MC tank coil also came in the rotary link version, although most of the ones Fair Radio had through the years were the earlier fixed link type.

> In testing the ME-165G with an antenna impedance test bridge shows it
> indeed to be 50 ohm impedance.
>

Yes, that's how it was designed.

> With all this in consideration, I must therefore conclude that the output
> of BOTH transmitters to be 50 ohm output.
>

Never said that, as modified, they weren't.

> tuning tables/cards.
>

I didn't go into the details, but the BC-729-(*) had a swinging link for loading. In the BC-939-A this was changed to an unbalanced rotary inductor. Two of the input feedthrough terminals in the BC-939 are grounded. The center one is not.

> There are also TWO different models of the BC-939. There is an A model and
> a B model. I haven't noted any obvious differences, but there apparently
> are some somewhere.
>

The BC-939-B came out circa 1951 with the BC-610-H. Differences between it and the -A are insignificant. Judging by publication dates, it would appear that the modification (for coax input) of some BC-939-(*) was about 1960, for use with T-368. Maybe there was a TN-339 shortage.

# 2380. T-368 Wanted

Yahoo group: T-368_BC-610
Date: 2005-10-29 20:32:41 UTC
From: Keith Densmore
Topic: 2380  Message: 2380

Greetings to All,
I am new to this list. I recently have scared up enough room for a moderate size transmitter. I'd love to try out a T-368, but they are nearly impossible to find in Canada. Therefore, if anyone has one, or a lead on one, I would be interested. It could be located in NY, PA, Michigan, or possibly northern Ohio. I've reviewed the archives here and I don't think they come up for sale often but it never hurts to ask. BTW, there is one listed on that place but he is in Atlanta.
Cash or trade

Thanks,
Keith, VE3TS

# 2382. RE: BC-610 terminating impedance

Yahoo group: T-368_BC-610
Date: 2005-10-30 22:43:11 UTC
From: Rbethman
Topic: 2374 Message: 2382

The biggest difference with the link in the BC-610s, is that the link is on a pivot joint that is fixed on the center line of the loading coil. You can rotate the link from vertical and in line with the turns, OR you can place it perpendicular to the turns AND anywhere in between.

You CANNOT take the link outside the coil proper.

This vastly limits the variability of load impedances.

I do not know when the fixed link coils ceased to be issued. However, the 1952 manual shows the issued coils to ALL be the rotating link variety.

The "animals" or as most refer to them, "Beasts", are indeed a horse of a different color.

The A, B, C, & D variants have different manuals - AND - may well have different characteristics. The E, F, G, H, I, and T-213 manual was published in October 1952.

My I variant is indeed a Hallicrafters manufactured one. So noted by data plate and Hallicrafters logo on the tuning units.

I believe my T-213 is a B&W manufactured one.

Both came with an SO-239 output connector. The I model also has the porcelain feedthroughs. When looking inside, I find the lines to the feedthroughs ALSO go with one to ground and the other to the center conductor of the SO-239.

As to polarization of antennas, there is no question that long haul propagation DOES constantly change.

My point was the use of the Mil issue 25ft vertical whip. As it has a very short length, its capture ability and transmission ability would be severely degraded in comparison with a manufactured Ham vertical. That was my basis for saying that I had no use for a "vertical" to be installed off the back of the BC-939.

I have consistently used dipoles and inverted vees for my station. I have had no issues, and have been very happy with the results with QSOs up and down the entire East Coast, and well into the Midwest.

Antennas ARE the only black art left. I have always found them to interesting.

As to my reference to the VSWR/SWR, I was explaining the reading into a 50 ohm dummy load that is internal to the ME-165G - NOT into a feedline. I feel very comfortable that the reading I referred to was indeed

indicating that the transmitter WAS indicating a 50 ohm unbalanced output.

Sorry - but I am NOT putting my antenna bridge looking back into the transmitter. I like my bridge, and am NOT looking to allow ALL of its "smoke" to depart.

The manual for these two radios ALSO states to connect the transmitter to the BC-939 tuner by COAXIAL cable.

I've only been using them for about 5 years.

I've had only one problem. It came when I tried to load up on a trap dipole. It FLAT doesn't like it!

Other than that - THEY ARE GREAT WONDERFUL "BEASTS"!

I love them and won't part with them.

# 2388. BC-610 ANTENNAS

Yahoo group: T-368_BC-610
Date: 2005-11-01 20:31:13 UTC
From: Norman & Barbara Ray
Topic: 2388  Message: 2388

Robert Downs information is right on!

The best use for the BC-939* is to say you have a complete original system. One can rebuild it but that is criminal from my perspective.

My BC610E with swinging link works just fine into normal doublets, loops or whatever. I did not alter anything but did go from the ceramic feed throughs to a coax change over relay which is mounted to the side of the cabinet using existing holes. This was to accommodate multiple AM rigs here.

To be safe I go into an "L" circuit tuner which reduces second harmonic output by 25db which I think is essential.

I have worked 24 countries on 80 meters using a quad loop antenna.

The BC-939 does work well with its intended antenna as evidenced by my bootleg operation during the Korean Conflict. I was able to work my buddies stateside on 20 meters consistently.

Relax and apply good old Amateur Radio Principles and have fun operating.

Norm W7LFA

Norm,

I agree completely!

I just happen to know another ham, WB2FCN whom ALSO runs his WITH the BC-939 using the appropriate wire lengths. Works just FINE!

I stumbled into the issue of a trap dipole by accident, BUT - did NOT lose a final before I caught it.

I converted a 2.0 Mc TU to work on 160. To do so is simple. Just add a 100pf disc ceramic cap in parallel to EACH internal variable cap. It will then go down to the BCB. So my only caution would be for those that do so, ENSURE you are in the 160mtr band BEFORE loading up!

We all enjoy our hobby and license!

I keep watching for an old used big box type ambulance. I may create a mobile station for AM use at hamfests. For that I'll need to find or make the whip bracket, and scrounge the base insulator and whip sections. Of course I'll paint it flat OD, place LARGE white stars on the doors, AND dig through my old military photo archives to find a USA number for the sides of the hood!

I have NO intent to modify these fine radios in any manner. We are simply the CURRENT caretakers!

Bob - N0DGN

Curious just what disagreement your 610 had with a trap dipole. If
installed properly and operating at the frequencies for which it was designed, such an
antenna would present a reasonable match for a 50 or 75 ohm feedline. From
a harmonic suppression standpoint not a good idea to feed directly off an
unshielded link but not likely to result in hardware destruction. I've operated
my T368 into an 80/40 M trap dipole for extended periods with no problems.
The T-368 uses a PI-L tank/output circuit rather than a moveable link, of
course.

As I explained in another message that aparently I did direct, The specific antenna is an Alpha-Delta. The "traps" are an inductor only. There is NO capacitor in them.

I suspect that if they were the "normal" LC traps that it would not have been a problem.

Antennas being the black art that they are, AND the BEASTS being their own entity of interest, Lord only knows why it didn't properly work.

Eventually I'll get enough dipoles up to support my habit!

# 2392. Re: [T-368_BC-610] BC-610 ANTENNAS

Yahoo group: T-368_BC-610
Date: 2005-11-03 16:34:37 UTC
From: Alan Cohen
Topic: 2388  Message: 2392

Back when I lived in Austin, Texas I ran my BC-610 into an Alpha
Delta 80-40 loaded dipole with no problems. The antenna was trimmed
to be resonant at 3885.

# 2393. T-368 blowing AC breaker

Yahoo group: T-368_BC-610
Date: 2005-11-03 20:19:19 UTC
From: John Poulton
Topic: 2393  Message: 2393

Just joined the group last week, and have a question for the assembled about the T-368 that I recently acquired.

The previous owner told me that "the plate transformer is blown", so before I powered up the tx, I took the power supply completely apart, meg'd the plate 'former, the filter caps, and the choke. All showed several G-ohms between terminals and case. The capacitors are both very close to 4uF. I powered the plate transformer up on a variac (no load) and measured 600VAC out on the secondary with 12VAC in on the primary. Nothing bad happened when I ran the primary up to 120VAC, with no load. No-load primary current was perhaps 50mA or so... Might be worth mentioning that the transformer was inverted (terminals-up) at the time...

Thinking all was well, I cleaned up the P/S drawer, which had a bit of oil on the chassis from one of the iron components (though which one, I couldn't tell!), reassembled, and reinstalled in the tx.

As I went through the power-up proceedure for the tx, grid-drive seemed normal, the PA dipped and peaked to the appropriate plate current in "TUNE" mode, and the tx appeared to be putting out about 50W (in AM "TUNE" mode). Was even able to modulate the carrier in this mode. But when I upped the plate voltage by switching to "OPERATE", there was a brief, loud rasping noise from the back of the tx (where I couldn't easily observe), and the 20A mains breaker in my AC panel blew. I also noticed that the indication on the power meter attached to the dummy load on the tx very briefly went north of 600W.

I repeated the power-up experiment again, but this time with the HV lead disconnected at the spring terminal at the back of the power supply drawer (no load on the HV supply). Again, all was well in "TUNE", but breaker blew immediately when in "OPERATE". From this, I infer that the problem is isolated to the P/S drawer. Checked the spring switch that shorts the HV output when the drawer is slid out, and with the drawer all the way in, it appears to be a good 3/8" or so away from the HV terminal, though it's hard to see when the P/S is in the case.

I'm about to take the power supply out and attempt further diagnostics, but do any of you have any suggestions where to start looking? I'm hoping this is a common problem..

Thanks, and 73, John K4OZY

Have you checked the HV rectifiers? Had the very same kind of issue
with a large ham transmitter, everything was just dandy until I hit
the plate switch, then out went one of the 15A fuses, every time.
Swapped out the 872Bs for 4B32s and it worked fine. I think the T-368
uses 866/3B28?

Ok, here's what I found on mine.

The wiring under the 3B28's was cracked and shorting
out under load.

This was very hard to see upon casual inspection,
especially where the wires go through the deck. The
correct wire to replace the HV wiring is expensive and
hard to find BUT, if you call Dearborn Wire and Cable
and whine pitifully they may send you a 10 foot piece
for an "engineering sample".

I wouldn't try to solder on the plate transformer
terminals, they may expand and leak, they are a pain
to solder to anyway.

Put a drip pan, PLASTIC, under the plate transformer
to catch any oil that may drip from there, just to
verify/deny that possibility.

Verify that the sparkgap on the capacitors is correct
before you get too far into the above mentioned stuff.

It may help to find the problem if you remove the back
panel and jump out the interlock but you didn't hear
that from me!

Speaking of which, it's not a bad idea to check all
the interlocks anyway, mine had bad connections and
charred wiring, they needed mechanical alignment, too.

One thing you could try is to power it up in the dark and see if you
can locate the flash!

I am sure there are better methods though...

+++++++++
Probably could, but it should have a high voltage
rating, I think I used 25KV wire, also, for some
reason the military spec was for 14 gauge wire. This
for a 1/2 amp circuit. Probably it was for mechanical
strength.

Why not RG-8 coax? I've got 2500v on a pair of
250TH's using coax asthe HV line.
+++++++
No, it has to be more flexible than that, RG-8 is also
too big for the places where this wire is used, there
is a LOT of it under the 3B28 sockets.

Well, RG8X might work.

Someone used what looks like RG-58 for mods to the 300G I'm restoring. Was a bc engineer too, because the added cable was used to cut in a Gates power adjusting unit for cutting back transmitter power (big honkin' rheostat). The original black wire circa late 40s/early 50s looks a lot like spark plug wire. Considering that spark plug wire has to handle high voltage and endure high heat, I've thought about using it. I want the original black though, not neon red or fluorescent yellow.

+++++++
Black isn't a problem, but the size of the conductor
might be.

I don't know what problems the shield on the RG would
cause either, it would seem to be a good idea to
solidly ground it so any induced voltage is
dissipated.

I am wrong- according to Belden's web site RG8X is rated for 300V RMS - no dc rating and talking with their rep there is no dc rating. RG8 is rated for 600 V RMS but we all have used it at 2.5 kv with out it blowing up.

I've got to speak up on RG-8. Some of our older HV DC power supplies in our lab use RG-8 as the HV leads. This includes our 60's era 30 kV supply (Sorenson, I don't remember) While I don't remember the particular brand, I do remember when rebuilding it the manual specified RG-8 as the cabling. It used the shield for electrostatic shielding. Worked well, calibrated to spec, passed all safety tests, etc. I've been on leave a bit over a year and a half, and I used it shortly beforehand with no explosions.
HOWEVER the item it was used to calibrate was a fairly low resistance. Is 10 megs low for 30 kV?

I've seen RG-8 or RG-213 cable being used by the manufacturer in UHF broadcast transmitters as high voltage wiring to deliver voltages as high as 33 KV at several amps to klystrons and IOTs. Polyethylene was the dielectric, not foam. I wonder if the numbers you are seeing in the Belden catalog are for foam?

# 2406. Re: [T-368_BC-610] T-368 blowing AC breaker (LONG)

Yahoo group: T-368_BC-610
Date: 2005-11-04 19:23:16 UTC
From: James M. Walker
Topic: 2406  Message: 2406

Ola John,
Well I have used both types of rectifiers, solid state and tube,
even put a pair of 866As in for giggles. Mostly if the 3B28s
are ok they work, only sometimes they get cranky. E'nuff said.

As for the test fixture approach it goes like this:

Remove the two connectors from the top of the chassis.

Place a throw rug directly in front of the transmitter.

Slide the power supply deck partially out of the cabinet, by pulling on the handles. straight out, don't pull all the way out. Then grab the handles by the top, hands in the bend, pull gently and lower the chassis to the rug.

Once the chassis is on the rug/floor reach into cabinet and lift
to set the chassis up on the handles. Now you can grab a portion of the rug
and the chassis and turn the unit around so you can see the underside
of the power supply and reach the circuitry.

On the chassis top, remove the time delay relay, and Don't break it.
Put it off to the side and safety. Next place the Tune/Operate switch
in the "TUNE" position.

Then you can put the output of a 0 - 125VAC variac to terminals
1 & 2 of the plate transformer. Put 115 VAC to terminal 1 & 2 of
the filament transformer, either directly or through a separate variac.

NOW This is VERY IMPORTANT, you will need an insulated
device, I use a piece of 1/4 inch thick by 1 inch square teflon and
place it in the space between the shorting jumper (Spring loaded)
known as E11 and E12.

Apply power to the filaments, give them a minute or two to warm
up if 3B28s. then bring the power up on the HV transformer, If you
have a HV probe for your VOM/VTVM use it and you can turn
the voltage as high as you like.

Note: turn the AC to the HV transformer up slowly, if there are
bad wires you will hear frying as you exceed 600 VDC approximately.

The Oil you are seeing is most likely coming from the filter caps. The
transformers insulated feedthru terminals are separated from the oil
filled area, of course if the transformer has been dropped on its terminals
all bets are off.

Now if you need HV cabling, I use and always have Belden 8899
cable comes in red and black rated for 5KV @ 1.5 amps. If it seems

flimsy to you slide it into a piece of tygon tubing 3/8 inch diameter,
which will give you an additional 2 KV of insulation, as measured with
a megger.

As for it tripping the circuit breaker in the wall, trouble spots to check
are the HV indicator (Red) case inside the front panel for frayed
wires shorting. Also a note of enquiry, have you checked the PLATE
current meter to make sure the spacer is in the unit, and is made of an
insulating material, mine is wood and painted white. Its' purpose is
to prevent the HV from shorting to ground through the meter housing.

The above description while it may sound complicated will if followed
allow you to find where the power out short is occurring as it eliminates
everything except the active components of the HV section.

YELL if you need more info!
Jim

I used to use one of my kids skateboards when I removed the power supply from the cabinet. Worked real well. I still think I have the skateboard around someplace just for that reason. The son we bought it for is now 29 and has not used it in over 15 years. -

Modern spark plug wire has a fabric center conductor that's
carbon impregnated to create a distributed resistance to
reduce RF interference from ignition systems. You'd want
to look for the old-fashioned, non-noise-reducing wire.
However, this stuff typically has stranded steel wire center
conductor, so it's not the greatest material to solder to.
Last time I had some of this stuff, it had white insulation...

As for the RG-xx coax, you could always remove the shield
and just use the center conductor and its insulation. The
problem with THAT is that the insulation is fairly delicate
mechanically.

Best thing is to find some authentic high voltage wire. Maybe
one of us could bite the bullet, buy an entire roll, then
share the wealth. I'll look into it, if it turns out that
the T-368 needs extensive HV rewiring..

John,
You really don't need to unsolder any wires to make these
checks. Also if you don't have the HV wire I will send you a
6 foot length of red and black Beldon for your HV wiring.
The control leads are just # 12 or # 14 as you see fit.

Again, for the oil leakage I would check the caps first.

FWIW

My previous message probably didn't make it to the list. sorry...

here it is, in it's entirety (and something added)

I still say RG-8 is good, and the sheild on mine is far removed from the
bare center conductor.

http://w5omr.shacknet.nu:81/~w5omr/hamstuff/AM-Stuff/Titanic/modulator/mod_underneath2.jpg

http://w5omr.shacknet.nu:81/~w5omr/hamstuff/AM-Stuff/Titanic/modulator/meter-driver.jpg

The second picture shows, closer-up, how the sheild is dressed back.

Here's a view (a bit larger picture - fair warning for those on dialup)
of the top side.
http://w5omr.shacknet.nu:81/~w5omr/hamstuff/AM-Stuff/Titanic/modulator/Picture%20007.jpg

*And another, showing better, the bottom of the recently homebrewed
modulator
*http://w5omr.shacknet.nu:81/~w5omr/hamstuff/AM-Stuff/Titanic/modulator/Picture%20013.jpg

As I bent the coax, I used a hair-dryer to cause the dielectric to
'form' to the new shape.

Yes, those are 250TH's in the modulator. They are modulating a pair of
250TH's in the final.

the modulation transformer is from a scrapped out (not by me) T-368.

# 2411. How big a worry is oil leakage?

Yahoo group: T-368_BC-610
Date: 2005-11-04 22:19:09 UTC
From: kd1yt@pshift.com
Topic: 2411  Message: 2411

The recent discussion of HV wiring issues included a mention of oil film around caps or big iron in a T-3, and that reminds me that I have been meaning to ask the group about that subject

I own a T-368E; unfortunately other demands on my time have prevented me from giving it the attention to get it on the air.

When I acquired it, I recall noticing some relatively minor oil film on the bottom of the HV deck and/ or in the bottom of the cabinet.

When I do turn my attention to the T-3, how much should I worry about finding the exact source of the oil?

If the unit otherwise operates OK, do I need to be concerned that some past leak has left one of the HV capacitors or one of the pieces of "big iron" compromised in a way that makes it more likely to fail and take other important components with it-- so that I should try to find the precise origin of the oil?

Or, as long as it is only a minor film and the unit otherwise works OK, is this something to not worry about?

Thanks &73, Trevor KD1YT

You could also stand the power supply deck on end with
the plate transformer down, then you could keep track
of both sides of the deck.

I've seen RG-8 or RG-213 cable being used by the manufacturer in UHF broadcast transmitters as high voltage wiring to deliver voltages as high as 33 KV at several amps to klystrons and IOTs. Polyethylene was the dielectric, not foam. I wonder if the numbers you are seeing in the Belden catalog are for foam?

+++++++
I would at least try to find where it is leaking, its not that hard to do. Just make a few drip pans out of plastic jugs, maybe 1 1/2" high, set them in the cabinet under all the oil-bearing equipment and see which ones catch drips.

How much it leaks isn't as important as how long it has been leaking and how big the container is.

Its no big deal to unsolder the fill-plug and peak inside the can. You can still get transformer oil, too, you might have to buy 5 gallons, but you can get it. I think I found it at $48/5 gal. which isn't all that bad to save a big transformer.

Who's the transformer guy in Arizona? I asked him about making an air-cooled replacement for the Plate transformer for a T-368, he quoted me $400, I think, but I never sent him the measurements for the mounting holes. I also thought it would be nice if the HV terminals came out the side instead of the bottom, he said that wouldn't be a problem either.

There should be plenty of room in the power supply drawer and air circulation should be sufficient for Amateur service, an air-cooled plate transformer should work in the T-3, it just needs to be tried and proven.

It just means that they haven't tested it with DC.
It doesn't mean you can't use it for that.

I suppose it is also a way for them to limit their liability of you short
something out with it!

# 2418. Re: T-368 blowing AC breaker

Yahoo group: T-368_BC-610
Date: 2005-11-07 16:35:42 UTC
From: John Poulton
Topic: 2393  Message: 2418

Finally tracked down the problem that led to the original posting about my newly acquired T-368 blowing its AC breaker. The problem turned out to be arcing from the rear spring contact on the hv power supply chassis to the nearby shorting bar. A bit of judicious bending of contacts completely solved the problem.

Was able to load up into a dummy load at up to 400W or so on AM, only to discover that my antenna system simply isn't up to the job! Will get that worked out, and then hope to join you guys on the air with some very nice heavy iron.. Next: clean up that BC-610E that's been lurking in the garage for a couple of years!

So.. about those mods I've been reading about on the Web. How do you guys feel about modifying these transmitters? Particularly the mod to shunt-feed HV to the PA..? Wonder why B&W didn't do it that way in the first place..?

But mainly.. **THANKS** to all of you who so kindly offered help and suggestions, particularly Jim Walker WB2FCN, who did a bunch of virtual hand-holding while I sorted through the possibilities.

Half the fun of this hobby, maybe more, seems to be these conversations with fellow enthusiasts, and hearing about their various experiences with the equipment we all love.

73, John K4OZY

Because it requires more iron, therefore more cost. Besides, the
transmitters designed for the military weren't worried about audio
quality, only in communication.

I'm not sure what the current rating is on the output tube of the T-368
(not sure what it is - I have a '610). I'm guessing it's a 4-250, for
around 350/400w output?
Lessee - off the top of my head, 400w out is around 500w (or a bit
better) DC input, so that's probably a 4-400, instead. Still guessing,
I'd say the B+ is around 2500v on the plates. That would put the plate
current around 250mA, or thereabouts.

The rule of thumb for figuring out how much Inductance to use, is 8Hy
per 1000 ohms of impedance in the final.
Using my best guestimates, that'd be something like...

2500v / 250mA = 10,000 ohms, means you'll need around 80Henry @ at least
250mA in series with the DC to the final to properly shunt the DC off of
the secondary of the modulation transformer. In my homebrew rig, I
ground one side of the modulator secondary, and the other side is
capacitance-coupled with around 4uF @ 4kVDC to the DC line that's going
to the final (on the final side of the choke)

>But mainly.. **THANKS** to all of you who so kindly offered help and

Isn't that what Ham Radio is supposed to be about? Ham's helping fellow hams because they share a common interest?

My friend, John Coleman/WA5BXO summed it up nicely...

_____
What AM Is To Me

by John E. Coleman, WA5BXO

Operating AM is not about communicating using the most efficient mode of transmission or the latest technology. It is about technical understanding of what is really happening in one's transmitter. Not just the standard old definitions but down in the nitty-gritty. It is about understanding the technology of old and new. It's about understanding why one circuit is better suited for a job than another even though both have the same definition. It is about home-brew equipment and modifications. It is about fellowship and a gentleman's mannerisms. It is about fun in learning. It's a little new stuff mixed with some nostalgia and used in a mode that is pleasurable to the operator and the listener.

Sounds a lot like Ham Radio in general.

Don't misunderstand me, there is a lot more to Ham Radio than operating AM. There are so many aspects of Ham Radio that I'm sure I could not do the list justice. For this I am glad. Ham Radio has always been the seeds of electronic and communication technology, and I hope it continues to be.

Somewhere deep in my brain are the memories of the days of learning and wonderment. I can not forget the first time I saw the bottom of the Sears 1950 TV as the repairman went in with his meter and hand tools to repair the set so that I could watch Roy Rogers and Dale Evans on the next Saturday Morning. All the tubes glowing and how did it get in there (the picture and the sound) I asked myself and many others. Then later, while in high school and having upgraded to general class, I was privileged to not only see some of the greatest radio transmitters to have ever been home brewed, but I was known by the men that built them on a first name basis. Walking in to the shack of K5SWK in the evening to see the 833s and 866s glowing and to hear the feedback from the modulation transformer and slight hum of the pole pegs is a memory that will always make me stop what I doing and ponder the nostalgia. Do I operate AM because I can't let go of a childhood memory? You bet I do. I hope to stir some of those memories in others if possible and to plant some seeds of my own.

Many Thanks and 73 to those Elmers

Wayne, W5FJS Otis, K5SWK Tom, K5IBW Koby, K5MZH
Jake, K5IQV Bill, WA5DWX Gene, WA5ATH Gene, W5HQJ

Roy, W5MRY Steve, K5LTK Ronnie, K5MKB Don, K4KYV

This is just to name a few and I know that a lot are silent keys and some have changed their calls. But I will always remember them with the calls heard first.

---

I wouldn't be where I am, in ham Radio, specifically AM Radio were it not for John showing me the way.
He's planted the AM seed in me, as well. John and I have known each other for better'n 20 years.

---

John,

The T-368 covers a very broad, continuous frequency range (1.5 - 20 MHz.) as compared to Ham transmitters. Shunt feeding the HV at the high impedance end of the tank circuit would require an RF choke that had sufficient inductance at the lowest operating frequency (lots of wire) yet was not series resonate ANYWHERE else in the operating range, a difficult design problem. B&W's solution, apparently, was to feed the HV in halfway down the Pi-L tank circuit at a lower impedance point which, in turn, allowed the use of a much smaller choke which could be manufactured with no troublesome series resonances. The stock system works just fine for the military, but the overall audio response of the transmitter is somewhat restricted. This is because of the 0.0039 mfd blocking capacitor (which keeps the HV off the "L" part of the Pi-L tank circuit) is effectively shunted across the mod transformer secondary at audio frequencies. Add the loading cap (vacuum variable) to this and the bypass cap on the incoming HV line gives a total audio shunt capacity on the order of .007 mfd and the audio response starts to roll off at about 1500 cps.

A worthwhile improvement can be achieved by merely reducing the blocking and bypass caps to .001 mfd each. I run my T3's this way. The tuning settings are a bit different from stock, especially on 160M but I have experienced no problems in over 10 years of regular use.

The popular "Timtron" mod (developed and written up by Tim, WA1HLR) involves feeding the HV in at the high impedance end of the tank circuit, using a .001 or even a 500 pf blocking cap and reducing the RF bypass cap to 500pf, giving a total shunt capacity of .0015 mfd, or less, with a concomitant improvement in HF audio response. Just be sure, though, that the RF choke used is not series resonant in any of the Ham bands you plan to use and be aware that the transmitter will probably not be useable over it's total original tuning range. Also, be aware that neither the popular B&W 800 nor the National 175 RF chokes have enough inductance for 160M and are marginal even for 75. RF Devices offers a unit that should work FB, however.

Bunch of other stuff can be done too, like bypassing the filters and clipper circuit in the speech amplifier, increasing coupling cap values, etc. The T368 is completely useable, though, without any modifications at all.

This is also covered in the "files section" on the
homepage of this list.

I think some found that the stock chokes listed below
got too hot in some ham bands and weren't well enough
suited to this purpose.

I tried a search for "RF Devices" for an RF choke. Is that their actual company name?

Tnx.

Joe, and the T-3 group...

Have been busy too...so don't get to jump into the discussion .... but am Lurking...I guess...

But...the comment about opening the oil fill hole in an oil filled xfromer caught my attention....
I passed up a T-3 HV xformer over at Fair...a few years ago...because it was wet......I wasn't sure about it and didn't know how to check the oil level or determine just where the oil was coming from...and/or how much might have drained out...could have weighted it I guess....if I had brought it home...

If it was around one of the insulators...and if it were a do or die situation, the xfrmer could be inverted...terminals up...then design a way to hold it in place....but...

Would really appreciate any comments on "how to" unsolder that plug, and then resolver it....I've never seen it done, and haven't read anything about how...

Sure enjoy the chatter re our big Ts....even though I don't get too much chance to join in....

++++++++++
Oh, I didn't realize it was a problem!

The fill and vent holes are small discs of the same steel that the box/container is made from, soldered in place and then the whole thing is painted at the factory.

To remove the disc I suppose it would be good to remove all the paint in the area which would reveal the solder seam, these are the two dimples in the top of ALL oil-filled containers, even the capacitors have them.

You'll need a good BIG soldering iron, probably 200 watts would be best, like the ones used to solder rain gutters together, it takes a lot of heat because of the amount of steel, and all the oil, sinking the heat away.

It really isn't that hard to do, if you can solder you know how to remove and replace these covers.

Joe

# 2436. Re: [T-368_BC-610] Re: How big a worry is oil leakage? (LONG)

well yes and no there Joe, and list members
The large oil filled transformers in the units like the
T-368 and BC-610 various models, have holes in
the top, which is determined by the mounting orientation
of the transformer. As in terminals up or down mounting.
Usually a transformer that is mounted terminals down
will have the holes on the up side away from the chassis.

I think the best thing to do is first determine if possible
where the oil is coming from. In the case of the transformers
and some chokes, around the terminals you will find a
rubberized ring between the insulator and the metal of
the case, most of those on transformers are not to keep
the oil in the terminals are in a sealed area and no oil is
there. So no leakage around the terminals, however if the
leak is elsewhere the oil tends to migrate under the device
in question due to the space under the unit.

The power transformer and the choke when originally
shipped, had a flat washer for spacing between it and the
chassis, then under the chassis there was a flat washer and a
split washer and nut for holding the thing in place but mainly
to dampen the Hum generated by the transformer/choke
when current passes through it.

To determine where the leak is coming from, it is a standard
practice to give the chassis a "degreasing" to clean the oil
away, power it up and run it under load, and watch for air
bubble and oil on the pieces on the chassis. While that
sounds difficult, at Depot service it wasn't. they had test
fixtures for that sort of thing. it can be improvised by first
cleaning the chassis with 409, or your favorite cleaner. then
laying kleenex or puffs around the suspect parts, run the rig
for about ten minutes into a dummy load (big) and then inspect
the tissue.

As for the soldering aspect, I found opening the holes was the
most difficult, but once it is open then you can clean the surface
around it, refill the device and tin the top of the hole easy
enough. with the "button" out it is also easily tinned, then a 100
watt iron is all that is needed to get the two to seal properly.

Similar to soldering outside, in the rain/snow in New York
State.
YMMV
Jim

Joe,

Thanks for the comments....I've seen such plugs for years...but didn't know if it was a weld dimple or just how it was assembled....dang, now I wish I had gambled on that xformer over at Fair, but that was several years ago.......grin...

Good to hear from you and suppose I now have to find a REALLY big Iron for that occsional repair....too bad these xformers and big caps aren't made with dip-sticks...sigh...

73,

Gene

With some folks selling shiny R-390A's for that price or
better, it may *very well* fetch that price.

It does look really nice and does appear to be somewhat
complete.

I am certain that particular BC-610, with all accessories, sold this year at the Gaithersburg Hamfest for $400. A known tube dealer bought it. The seller was really upset when he was told that it went to a re-seller. It was supposed to be sold to an end-user/collector, not to generate revenue. The unit came from a Govt. lab and had, we were told, been sitting for years in dry storage. It IS a very fine unit, to be sure. I (and a few others) were about 30 minutes too late!!!.

The actual price was $500.00 and that included delivery to Fairfax, VA. I know the purchasers name if you want to deal with him. I think he was mainly after the tubes since he usually deals with tubes and stereo gear. I don't think he is a ham. If it will make you feel any better, probably a dozen folks, including myself had a shot at the rig. If I had the room, I certainly would have grabbed it. As far as I can tell, the only bottle missing was the 250TH final.

Hi John,

I saw it in person and looked at it very closely. I really wanted it and had the money, but I somply have no room left for something that large and the weight makes it near impossible to move around, even with the included rollers.

The seller stated that it was in a lab where he worked and was used to drive some kind of industrial heating equipment. Outside of some scratches on the top and sides, it was exceptional. The front panel was excellent but there was some question about one of the meters which did not look standard. Not being that familiar with that particular model, I can't say. It was definately nice. The 250TH was missing and the auction seller, who deals in tubes and hi fi gear, appears to have installed a new tube in it. Notice how shiney it is compared to all the others in the photos.

# 2448. BC-610 MODULATION

Yahoo group: T-368_BC-610
Date: 2005-11-11 23:33:15 UTC
From: Norman & Barbara Ray
Topic: 2448  Message: 2448

I have been exploring some changes in the modulation output circuit. I would like to lift the HV off the modulation transformer using a choke to feed the modulated signal to the 250TH and Isolating the transformer with a capacitor. This scheme was used in some broadcast transmitters to improved phase-shift characteristics and low frequency response. My "senior Citizen" memory seems to recall using a high inductance (25-35 hy) and a couple of mikes of oil filter capacitor.

Any experience out there/

I have a Stancor C-1415 choke which I am sure is in the 10hy range but can't find it in my Stancor catalog. I also have an extra power supply deck which has the 11hy choke, but I am sure one would want an audio reactor of higher value.

Been mulling this over in my mind while watching the TV waste land.

Any Thoughts?

>
>73,
>
>John, W4AWM
>

The rule of thumb on using a reactor to shunt the DC off of the
secondary of the modulation transformer, is 8HY per 1000ohms of Z in the
final.

Z = Vp / Ip
in a '610, that's roughly
Z = 2500v / 250mA
Z = 10k Ohms

L = 8Hy per 1000 ohms
L = 80Hy @ (at least) 300mA.

Hard to find one choke, with that value. It's not a problem to string a
few chokes together, just watch out for the total DC resistance.

In my Homebrew rig, I've got 8 10Hy chokse @ 500mA in series with the B+
line to the final, from the power supply.
One side of the modulation transformer secondary is tied to ground.
The other side of the modulatoins transfomer secondary is tied to 1 side
of a 4uF choke @ 4kVDC
The other side of the cap is connected to the final DC input line (final
side of the choke).

Hope that helps.

That's all mostly true (except that B+ in a BC-610 in Voice mode is 2150VDC). But why would anyone want to do this to any self respecting BC-610? In the first place you can't legally take advantage of it. And in the second place, they sound just fine the way that they were built.

No one is more concerned about changing the configuration of "historical jewels" or more tragic is the physical changes that can not be reversed than I.

That said.....the BC-610E that I restored had a blown modulation transformer. I have talked with numerous owners and many have indicated that they also had blown theirs. They maintain that they were very careful in transmitting under the specifications including proper limiter settings.

Keeping in my tradition to maintain these rigs for future generations, I felt it was prudent to explore means to accomplish this.

Since the use of a choke is considered good engineering practice in the broadcast business, I had further stimulation to explore their use in the BC-610.

I guess, each to their own. I do thank those who shared their experience both on the reflector and off.

LONG LIVE THE BC-610 ***.

Isolate the transformer off of ground, and try it again. If it's still shorted, then short the one side of the secondary to ground. leave the transformer above ground. The short-to-case may be in the primary. It may only be a HV short (like mine is).
No B+, no short. No problem ;-)

Look folks,

Don't modify the BC-610s, PLEASE!

First, they already do a VERY fine job. The modulation transformer have a frequency response from 200 cycles to 3000 cycles.

I have to keep mine throttled down to keep it within LEGAL limits! When properly loaded, AND carefully watching the Bird 43 with peak reading ability, I see it running into the 2500 W zone.

I like my hobby and license, so I throttle them back to keep both.

The audio sounds great both by monitoring my OWN signal, and by reports from others!

Remember! We are only the current caretakers of these magnificent radios! They will NEVER be made again!

>

Note that I was referenced in Bob's e-mail (see above). I share his antipathy in regard to modifying fine old classic rigs such as the BC-610 and completely agree that the 610 works very well as-is. However, the old rig isn't perfect and there are some non-mutilating, easily reversible changes that are worth incorporating. As an example, the carrier hum and frequency drift many 610s exhibit when operating in the MO mode can be virtually eliminated by a few internal component additions, see N6PY's articles in recent issues of Electric Radio.

Where one draws the line is an individual judgment, of course. Don't guess I would incorporate a modulation reactor into either a BC-610 or T368 and don't see how this would be possible internally in any case. (But, might be fun to add one outboard temporarily to see if this really gives any improvement.) If faced with a blown mod or power transformer, though, I wouldn't hesitate to install a non-original replacement to keep the equipment on the air. Ditto "Orange Drop" and other modern replacement components. Kinda the same thing as getting an artificial knee or an organ transplant to keep my old carcass running a while longer.

Gents,

Re use of RG for HV use...I have a Heathkit "Chippewa" Linear....using a pair of 4-400s....the power supply is a separate 'hundred pounder' with a huge oil filled HV xformer....shades to the T-3; it uses coax for the HV run to the RF deck....

I haven't used this amp in many years...but it is coming up in the Q for rehab. I always wondered about the coax usage for the HV....and in the context of the Johnson 500 that uses 'wimpy' line that has only a braided shield on relatively light weight conductor for its single 4-400...??

I don't recall just what connectors are on the Chippewa HV line but I think they are N type connectors....I'll take a look at this based on the discussion of moving HV from point to point....in any event...that amp did a great job and ran without problems for many years until travel put it into storage...

Great discussion...and new interest in checking out the 'old' techniques that appear to still be the way to go...might be worth up grading the Viking 500 to coax...in the interest of pure safety...

# 2466. RG8 as high voltage feed

Yahoo group: T-368_BC-610
Date: 2005-11-24 16:25:51 UTC
From: K3PID
Topic: 2466  Message: 2466

I've used RG8 successfully as have others. I've even used it underground to supply pulsed 2500 volts to an electric fence. I see ratings for RG8 ranging from 4Kv to 6 Kv. RG8x is much lower. Grounding the shield creates a more uniform field and thus reduces the chance of a corona discharge. Here is an interesting discussion on the subject but I am not sure of the writers credentials :>)

Hi Dudley,
If the plate current meter is still in the plate circuit, and you remove the insulator ring, and the meter circuit goes west, it will develop a direct short to ground on the HV supply, resulting in a loud bang, (don't
ask) followed by circuit breakers tripping, followed by much wailing and gnashing of teeth. Also words of an unsavory type will be forthcoming.

That insulator is an important part and unless you have a meter that won't pop unexpectedly, you might want to leave it in.

YMMV

Dudley,

I read this original post earlier today but aside from thinking briefly "another unnecessary modification" and not saving the message, the consequences of the question didn't register. But Jim is right. I don't know what modification you made to remove B+ from L2 (or why). But unless you changed the PA plate current meter to be a cathode current meter or just disconnected it, it still has to have B+ on it.

# 2470. FS: B&K Compressor Amplifier

Yahoo group: T-368_BC-610
Date: 2005-11-27 18:30:01 UTC
From: Brian Carling
Topic: 2470  Message: 2470

FOR SALE:

B&K Model CA-300 Compressor-Amplifier -
transistorized.
Neat little package great for processing AM speech
envelope for greater talk power.
I think this may also be a limiter.
Has two adjustment controls on the front panel for
compression, level,
and on-off switch. Neat little green cabinet with
rubber feet.
Input jack uses a large 4-pin female connector and
the output is via a shelded cable with a male 4-
pin connector. Uses 9V Battery.
Available for $25.00 plus shipping.

No one replied to my question about what was wrong
with the T-368 that sold on E-bay recently!!

Must be no one saw it, or no one looked.

The insulator on the PA Current meter was MISSING!
The meter was mounted directly to the fron panel.

Joe

The owner may have shifted the metering over to the center tap of the xformer. The meter doesn't need insulating then.

The answer is only of theoretical interest as I don't have a T-368 (and triodes don't have screen grids). But how does the screen current of a 4-400A tetrode vary as you tune the plate through resonance? Murphy being as he is, I'd expect it not to track the plate current. :-)

I noticed it Joe, and I bid on the unit, however I also have the correct meter with the insulator ring, as I figured it would be no problem.

I exceeded my own recommendations and bid TOO MUCH, I didn't win and I think that is a good thing. Since I would have had to drive to GA. to pick it up and drive back. He mentioned some mods but wasn't specific when I asked about them. I was looking for one that hasn't been severely modified as I want one for RTTY use with my R-390As and CV-116 and the MD-239 one nice setup solely for RTTY use, with the CV-116 giving dual diversity on receive if you have two antennas feeding the receivers.

I couldn't make out the strangeness of the power supply so after I was out bid I forgot about it. Nice chunk missing from the bottom of the modulator face though, can't quite make it out if it was bad or not.

The meter looks like the correct value, but unless it is in the cathode I would definitely change it back to original form.
FWIW YMMV

As for tracking the plate/screen currents are not separated as much as
one might think, and the plate voltage is dropped through 80K 200 watts
and then applied to the screen of the 4-400A, works quite well and it
gets a little of the modulation as well that way. The answer is not
much.

This discussion prompted me to take another look at the eBay picture and also the RF drawer of my own Basic model T368. Copied the pix off eBay and blew it up for a closer look. First off, appears the meter in question is still hooked up in series with the HV line into the PA plate circuit. The meter does not appear to be original, though, and uses threaded studs for the electrical connections on the back of the case vice the solder lugs found on the meters usually installed in these rigs. Also has a plastic case instead of the sealed metal enclosure found in my Basic and as seen in the adjacent meter of the front panel in the eBay set In my Basic the plate meter is obviously set further back from the front panel by the insulator ring. In the eBay unit, the meter appears to be thinner front to back so the setback by an insulator ring would not be obvious. However, I still can't tell for sure and very bad practice, of coures, if the ring is in fact missing.

Noticed a couple of other things. The two coax connectors on the upper LH corner of the front panel of the RF drawer have been replaced with indicator lights, function unknown. Also, looks like a regular 807 plugged into the clamp tube socket instead of the specified 5933 (807W). Every T368 I've seen has a metal sleeve mounted above the clamp tube socket which allows only the skinny 5933 to be inserted. This sleeve appears to have been removed in the eBay set which raises an interesting point.

The clamp tube in the T368 is triode connected and so the 4-400 screen voltage appears both on the plate cap and on pin 2 on the tube socket underneath the chassis. Nominal CW screen
voltage is 560 (from the manual) and peak voltages would be significantly higher under modulation. I suspect that because of it's straight through button-base construction the 5933 will tolerate higher base pin voltages than would be possible with a regular 807. Hence, the inclusion of the sleeve to prevent plugging in the wrong tube. No mention or discussion of this in the manual however, and no mention of base breakdown voltage ratings in any tube specs I've seen.

Anyone know more?

Yahoo group: T-368_BC-610
Date: 2005-11-29 03:21:36 UTC
From: Joe Foley
Topic: 2477  Message: 2478

Well, yeah, but what most convinces me that the meter
is wrongly attached is the picture of the complete
front of the T-3, there it is obvious that the meter
is too far forward, unmistakable there.

Those indicator lights,..... hmm, could be just covers
over the BNC connectors I suppose, maybe had some left
over lenses in the junque box.

I'd like to see his rack for the ME-165.

I take it that no one on this list bought this thing?

Topic: 2480  Message: 2480

Hi,

Anyone have a spare, functional, 0-15A RF ammeter to fit the BC-729 or BC-939 antenna tuners or know of a supplier? I believe one meter type fits both models.

TIA,

Roger Basford, G3VKM - Norfolk, England.

Hi All,

I've been lurking for a month or so on the group but I've now become a BC-610 owner so it's time to declare an interest and ask for some advice from other owners!

My new toy is (alledgedly) a BC-610-D, at least that's what it says on the Hallicrafters nameplate, but the meter and switching arrangement on the front panel looks to be a BC-610-E layout, so perhaps the nameplate is bogus and taken from another unit. Anyway, it is in good restorable condition, missing only one 100TH from the tube complement and has a good selection of tuning units and PA coils. It also has the BC-614D speech amplifier (anyone got a manual for this version?), a JB-50A, BC-614-E (have manual for this one), BC-939 ATU (less RF ammeter) and a nice BC-342 and speaker to go with it. The rig came from a UK film-props company who provided venues and some equipment for the HBO "Band Of Brothers" series, unfortunately my '610 didn't get a "lug-on" role!

So, a few newbie questions; any other means of establishing the version letter of my 610? Did earlier models get updated to the later specs, as this one seems to have had a paint job at some time so maybe it was upgraded at the same time? Do I really need the heater resistor on the modulator deck, as it's missing?

LOTS more questions to follow, I'm sure!

73,

Roger Basford, G3VKM (Norfolk, England)

Topic: 2481  Message: 2482

Roger,

First, the heating element isn't used for heating. It is switched in series with the HV transformer primary when one of the front panel switches is placed in the TUNE position.

BC-610-A through -D and BC-614-A through -D are covered in TM 11-280 on SCR-299-A through -D. Reprint available for $26.30 plus shipping. Includes Change 1.

The BC-610-D has five meters (and a tuning dial) across the top of the front panel. The BC-610-E only has three meters (and dial). In the -E, the grid current meter was dropped and the Modulator Plate Current Meter moved to the BC-614-E. If the transmitter you have only has three meters, it's an -E. There was nothing ever in print that I know of about any BC-610-D's being modified to -E's. Last -D I've seen was summer of 1965, but it was still original (and still belonged to the Army).

I'm still looking to see whether I have an RF ammeter.

Roger,

Fantastic!
I'm glad to hear of another BC-610 being saved especially in the UK.
When you get it restored let us know so we can schedule a transatlantic QSO.

How about trying to join us one cold winter night on 3570 CW for the Old Military Radio Net?

Geoff,

Sunday nights at 2100 eastern there is a set scheduled net - OMRN. Usually Ted W3PWW is NCS, alternate is Chris AJ1G. All are welcome...no, ENCOURAGED to check in so we can hear key clicks and chirps. There are lots of different Mil rigs from QRP BC474 to T368. Now that winter is getting close, some of us will monitor 3570 when in the shack..whenever. Dale, KW1I, W1NZR, AJ1G and others often leave a receiver on 3570. Its hit or miss depending upon who is home but put out an occasional CQ. It seemed to get much more active as winter really set in last year.

# 2486. New BC-610-E Owner!

Yahoo group: T-368_BC-610
Date: 2005-12-14 07:20:00 UTC
From: g3vkm
Topic: 2486  Message: 2486

Hi Everyone,

Well, since my newbie posting I've had lots of mail from list members offering advice and support, many thanks to you all! Will answer all of you off-list later today. We've definitely established that I have a BC-610-E, not a "D" model and so it looks as though the maker's "D" nameplate is off another rig. To be fair, the rig has been in storage for quite a while, the seller described it as an "E" and was surprised when I read out the nameplate, so there's no question of misrepresentation.

After a session with detergent and hot water yesterday the exterior and accessories have come up quite well. The lettering looks to have done by hand, possibly after a repaint or touch-up job, but is adequate for now.

All being well, I will get the electrical evaluation done before the holidays and get some parts ordered.

Again, thanks to all for the encouragement, advice and manuals, I'm very grateful.

73,

Roger Basford, G3VKM - Norfolk, England.

Roger,

I once bought three T-213/GRC-26's (converted BC-610's) from a militaria dealer in OK. He had bought them (in the crates) at Tinker AFB. One was wrinkle finish and one semi-gloss, both with silk-screened lettering. The third was semi-gloss with hand-painted lettering. So it's impossible to say for certain of course but your -E could be "official" aside from the nameplate.

From: g3vkm
Topic: 2488  Message: 2488

Hi All,

Just checking over the electrical work needed to get my '610-E operational.

The two HV interlock switches from the tuning unit and PA coil doors have been removed and it's not obvious to me where they mount, can't see them in any of the manuals either. Do the doors have a door-catch fitted, a sort of ring-pull type? If so, mine are missing. Any info, or better photos, appreciated!

73 and season's greetings to all,

Roger Basford, G3VKM

# 2491. Straps on T-368 RF deck

Yahoo group: T-368_BC-610
Date: 2005-12-17 19:19:17 UTC
From: Jim Coe
Topic: 2491  Message: 2491

Hi,

I'm in the process of bringing up a T-368F built by Oneida Electronics against order no. 15498-PP-63. It is s/n 019.....

While making the RF deck mods to remove the HV from the tank and the plate current meter, I have also been performing a general clean up. The copper chassis
is in very nice condition, but there are two non-copper, L-shaped straps fastened
across the back rear corners which are quite corroded. I took them off (they are fastened with two screws each and there was some form of thin, non-metallic insulator between the straps and the chassis. The insulating material was very dried out and crumbled when the straps were removed. I looks like it may have been some type of mastic tape? Its purpose seems to be to isolate the strap from
the copper chassis to prevent corrosion. The screws were plated, but had some corrosion.

The straps are fastened with one leg on top of the chassis at the rear corner and
one leg down the back panel. The straps are approximately 2 and 3/4-inches long total with 1 and 3/4-inch on the top of the chassis and 1-inch down the back of the chassis.

After cleaning the corrosion off the chassis, I looked to see if I could find a reason
for the straps to be on the chassis in the first place. The straps are not structural
as the chassis is welded at the corners. The straps do not touch anything in the
cabinet when the deck is installed and I see no reason for their existence......but
I figured the government must have had some reason for paying to have them fabricated and installed so I thought I would ask the group for its combined wisdom
before simply discarding the straps.

Any clarification will be much appreciated.

Thanks es 73.....Jim W5JI

# 2492. Swap: BC-610 TU-52 for TU-54?

Hello Alan & Fellow Collectors,
Congratulations on a GREAT FIND.
CHRISTMAS ALWAYS FINDS SOMEONE EARLY.
In all fairness, it would be a generous gesture to share some photos of your treasure.
Now, what exactly does that tool box look like. Someone must has one or can describe it's construction and dimensions.
Wishing each of you, a Blessed and Joyous Merry Christmas.
One filled with good health and fabulous finds from the past.
Thank you Alan, for sharing with us. You made my day.
Of course, in my business, CHRISTMAS IS EVERYDAY.

There seems to be a conflict as to the size of R2 in the BC-610e. The parts list in the TM 11-826 manual identifies it as a 5000 ohm, 18 watt resistor. However, the schematic in the same manual as well as the schematic in the SCR-399-A maunal refer to R2 as a 5600 ohm, 18 watt resistor. The difference, considering the location of the resistor, probably makes little if any difference. However, I'm wondering if anyone has had any experience with it going bad and what value they used to replace it? Mine has obviously been too hot as it shows serious signs of losing its smoke and has changed in resistance to over 7000 ohms.

Thanks,
Rick

FYI, my SCR-299 manual (TM 11-280) says 5600 ohms for BC-610 models A through
D.

Smoking R2, may happen, if your unit was used in RTTY mode
with the O-39 FSK generator. Not sure why, however, but in my
"E" model I just changed the 5600 to a 20 watt and had no more
problems on RTTY, with that resistor.
YMMV

Rick, Dennis & Group,

I still don't know what the answer to this conundrum is (whether and in which transmitters the bleeder resistor R2 should be 5000 or 5600 ohms). I noticed that in the parts list in TM 11-826, R2 for the -A model had a different Signal Corps Stock Number. However, when I looked up the two stock numbers I found that the only difference was that the one in the -I is given as +/- 10% resistance tolerance (so that is a typo in the parts list, which shows +/- 5%). Otherwise everything else in the two descriptions was word for word the same.

# 2504. BC-610-E to BC-939 interconnection?

Yahoo group: T-368_BC-610
Date: 2005-12-26 18:14:16 UTC
From: g3vkm
Topic: 2504  Message: 2504

Hi All,

A few queries on ATU operation.

I have been looking at my BC-939, as I intend to use it with my '610 on wire antennas to provide good harmonic suppression. How are the two units interconnected? It looks from the diagrams in TM 11-4057 as though coax is used, presumably with the wiring bared-back and crimped with eye terminals at each end, rather than using coax sockets. What type of co-ax is recommended and any restriction on length of the cable? Any preference on which of the two feed-thrus on the BC-610 gets the coax braiding?

By the way, I'm still looking for a 0-15 amp RF meter for my 939, if anyone has one in the junk box? Alternatively, has anyone used a current sensor instead with a suitably-scaled replacement meter?

Happy 2006 to all,

Roger Basford, G3VKM - Norfolk, England.

Roger,

Am sure you'll receive a number of responses to your questions.

Going through my SCR-299 and SCR-399 manuals (TM 11-280 & 281 respectively) I can find no specification for the RF cable connecting the transmitter to the ATU. Various illustrations in both manuals show a connection that looks like a short length of coaxial cable but no mention found in the cordage lists. Only a single reference to a "concentric transmission line" in TM 11-280 with no further information given. Might have been provided as a part of the ATU (BC-729 or 939) and perhaps someone with a better parts list can provide more information.

In any case, any type of coax capable of handling the power level of the BC-610 would be OK here. Impedance not important unless you plan to mount the ATU some considerable distance removed
from the transmitter. RG-8 or RG-11(or UK equivalents) should work just fine. Which feed-through gets the braid and which the center conductor not important on the transmitter end unless one side has been previously grounded. The braid should go to the ground terminal on the BC-939 end, of course.

On using the BC-939, be advised that the unit was designed primarily for use with short (at the frequencies covered) whip antennas. The "Long Wire" position found on the front panel provides for somewhat longer lengths but still less than 100ft. A stock BC-939 will not generally match the multiple wavelength "long" wires most commonly used by hams and described in ham literature.

The BC-610 is a fine old classic. Enjoy!

Hi Dennis,

You've turned pretty much the same selection of references I had. Did think, at first, that they used some sort of Twinax cable and only grounded the screen at the ATU end but on closer examination the 939 input is connected internally by a length of rigid coax to the meter, etc. Yes, other people are telling me that the 939 isn't much use for ham antennas so I may have to reconsider that as the station ATU, the TMC TAC-1 has been recommended but TMC stuff is gold dust in the UK. The BAMA manual for the TAC-1 does show it in use with a BC-610, so it would seem to be the right tool.

Anyway, thanks for the advice and info, all useful stuff towards getting the beast operational!

73 Dennis and HNY,

Roger, G3VKM

From: Brian Carling
Topic: 2508  Message: 2508

FOR SALE:

NEW CERAMIC HC6/U CRYSTAL SOCKETS.
These are for the metal can crystals with pins
spaced
about 1/2" apart. These are new, ceramic sockets
usable
all the way up to VHF. Single screw mount, with
solder terminals.
Great for amateur radio homebrew or repairs.
They have 0.486" pin spacing. Smaller diameter
pins than FT243.
These mount with a single hole. Dozens available
as follows:
Reduced from $3.00 each.
Dozens available for $1.50 each or 10 for $10.00
plus shipping.

Hi Roger and list,
For the BC-939(*) tuner/coupler, the connection that seems
to be on all the ones I have seen is a "CX" type cable, which
is RG-8A/U cable. If your transmitter has the coax connector
modification done to it already, you will notice the loop coil
contacts go to an SO-239 connector. The contact that is most
rear-ward on the socket for the swinging link goes to the chassis
or ground and the front-most goes to the center of the connector.
This is at the transmitter end.

If your transmitter has just the large feed thru insulators the cable
making the connection has the shield of the coax going to the rear
most feed-thru insulator, and the center conductor going to the front
most insulator. I may have some pictures Roger if you want to see it.

On the BC-939 there are three terminals on the left side facing the unit.
starting at the front most terminal that is ground and is internally
jumpered
to the rear most terminal. The middle terminal is the center of the coax
feed to the input matching circuit. If you make a 3 foot length of cable
to connect the two units that seems to be the correct length.

On both of my transmitters, I have a two foot length of coax with connectors
SO-239 going to the RF output of the transmitter. Then to a Johnson
TR switch to the transmitter connector. From the antenna connector on
the TR switch another two foot cable goes to the BC-939(*) RF input.
The receiver coax connector goes to an HQ-129X receiver for each
transmitter setup. The TR switch handles the output of the BC-610,
and provides amplification and a closer match to the input of the HQ-129(X)
receivers which is close to 150 ohms.

# 2510. Re: [T-368_BC-610] BC-610-E to BC-939 interconnection?

Yahoo group: T-368_BC-610
Date: 2005-12-27 17:01:43 UTC
From: Roger Basford
Topic: 2504  Message: 2510

Hi Jim,

RG8 is no problem, I have a drum of H100 here that will approximate. My '610 has the two feed-thrus fitted, no mods have been done in the output circuit, the 939 has the three feed-thrus. I'll be using an active receiving antenna so there's no real need in my present shack arrangement for T/R switching so I think it's better to leave the antenna relay "as-is" and ground the output winding on receive.

I haven't seen any info on the PA coils with swinging links, are these for an later version than the '610-E? I ask because I have a few amongst my fixed coils here.

73,

Roger, G3VKM

Roger,

The rotary link coils started coming out in early '43 when the Signal Corps started issuing the dipole antenna kits. They were supplied (at least if you ordered the dipole kit) for all models from -A on.

# 2512. Re: [T-368_BC-610] BC-610-E to BC-939 interconnection?

Yahoo group: T-368_BC-610
Date: 2005-12-28 07:36:33 UTC
From: Roger Basford
Topic: 2504  Message: 2512

Hi Robert,

OK, all understood. I've now been given a reference to the coils with the swinging links; they are mentioned in TM 11-826 which covers the "E" '610 and the later models. No real need for them if I use the BC-939 tuner but would be OK for dipoles, etc. Don't think they would add a lot to the harmonic suppression of the '610, although using a resonant antenna will help somewhat. It's pity they didn't modify the '610 so that the link could be easily adjusted, as in that comparison photo I sent you of the 610 and the British Mark 214 coils recently. It's been suggested to me that the BC-939 would be a better tool if modified as per N6PY's 2004 articles in Electric Radio, certainly it increases the range of antenna lengths one could use. Any views on that?

73,

Roger, G3VKM

# 2513. Modulation Transformer...

Yahoo group: T-368_BC-610
Date: 2005-12-29 23:10:58 UTC
From: Rick Brashear
Topic: 2513  Message: 2513

Hi all...

Does anyone have the specifications or know anything about a Thordarson T-21 M85 Modulation Transformer? She's an oldie, I think. The only other markings on the thing is 300/500 watts.

Thanks and 73,
Rick
K5IZ

# 2514. BC-610 modulator...

Yahoo group: T-368_BC-610
Date: 2005-12-31 17:04:53 UTC
From: Rick Brashear
Topic: 2514  Message: 2514

Good morning...

Has anyone had any experience with omitting the 40 mfd @ 100 wvdc (C27) electrolytic capacitor in the "E" model BC-610? The text in the later models explains this capacitor was no longer used as a by pass to the 750 ohm resistor (R20) and this improved the linearity. I assume it is in the circuit to keep AF out of the supply. I'm wondering, are there any other peculiarities of the "E" that the removal of this capacitor would affect? The old metal style paper electrolytic that's in mine is no longer usable and I am trying to decide whether or not to replace it.

Thanks,
Rick

# 2515. REDUCED: BC-669 CRYSTALS TYPE DC34 for 160m, 80m

Yahoo group: T-368_BC-610
Date: 2006-01-01 16:29:12 UTC
From: Brian Carling
Topic: 2515  Message: 2515

FOR SALE:
Twelve DC 34 Crystals Type DC34 as used in BC-669 Transmitter.

1690, 1830, 1830, 1830, 1850, 1850,
1870, 1910, 1910, 1910, 1930 and 3655 kHz.

DC-34 - Crystal 1-3/8" wide X 1/2" X 1-3/8" tall.
Pins 3/4" apart. 1/8" dia. X 5/8" long.

REDUCED from $12.00 each.
Total of twelve of these offered at $6.00 each or all for $50.00
plus shipping.

For picture and the holder size and dimensions see:

Hi Bob,

I am in the process of restoring a couple of BC-610's. I hope to have
one in the window in a day or so. I saw your picture on QRZ and that
T-368 is a jewel! I'm a little west of you here in Dallas. I look
forward to working you soon.

# 2518. I Need A Power Resistor

Yahoo group: T-368_BC-610
Date: 2006-01-02 22:36:09 UTC
From: ab3l1@aol.com
Topic: 2518  Message: 2518

I start '06 with a heavy heart.

With haste I was trying to get the T-3 ready for the Heavy Metal night. When you get tired sometimes you forget procedures and ah..... well now I need R-4. It is an 80K wirewound, 10 1/2 inches long and, from what I can read on the faded printing, looks to be a 210watt??

How close should the value be to the original if I find a something close?

This baby feeds to the 4-400 grid and the clamper plate.

Can someone help me find one? Cash or trades........

Thank you,

Bob AB3L

Bob,

Wonder how R4 came to grief? Anyway, there's another BIG 80K job down in the power supply, R58, the HV bleeder resistor. If you have trouble finding another 80K replacement for R4 you might move R58 up to the RF deck and replace the bleeder with something else. Exact value not critical for the bleeder (100K for ex., OK) just make sure the power rating is high enough.

Hi Guy's,

I'm embarassed to tell but...

I was attending to a mike connection with the soldering iron. The mike was still attached to the Radio Shack audio amp which was still attached to the T-3 which was still in the broadcast mode.

Like I said I was tired and in a gotta get it done mode. I forgot that the T-3 was still in test.

I put a meter on the soldering iron and saw milivolts to ground but thru the amp and the reverse fed tranny hookup for the audio must have put the RF over the top. R4 burned a ring around it.

The more strange thing to me was the tank caps melting out. Strange because the C-41,42, and 7 were jumped out. The former owner of this rig apparantly did the HLR mod and left the caps in to provide terminal mounting points.I bought the rig this way and only saw what was done when I really got in there to remove the caps.
One side(input)of the three had the shorting bar as I would expect from the factory. Another bar was connected to the input side and jumped across one of the caps and then onward to the S4(as I remember here at work without schematic)/coil assembly. So in other words, the three were left in there but out of the circuit by way of the jumper bar.
I guess the RF had to go somewhere and picked the caps? I have a Heathkit cap tester here and all three tested good with it but the leakage test only goes to 450v if I remember right.
Anyway, the plastic housings on the Sagamo .001's were bubbled toward their bases because of heat. The .002 made by someone else looked OK. The goo was dripping down onto the rectifier below from the meltdown.

I will be leaving the three out and get the tank hooked back up some other way.

I don't have a parts list for this thing. Maybe there is a TM that goes into this but I don't have it.
Can someone tell me what the correct wattage is on this resistor? I saw a listing for a larger value resistor with the same length and maybe a 220W rating. I can use Dennis's idea of moving the bleeder up.

As I said, embarassing, but this is how we learn. This is also how we get killed so next lesson is don't rush!!

Thanks Dennis and Joe for the reply as well.

Bob AB3L

That is a 200 watt resistor 80K, Ohmite part number is
L225J80K, try Newark Electronics.

That resistor drops the HV and supplies the 807W/5933 which
controls the screen supply to the 4-400A.

Mouser Electronics has them at -->
http://www.mouser.com/index.cfm?&handler=data.listcategory&D=*225*%2b*watt*%
2b*80K*&terms=225+watt+80K&Ntt=*225*%2b*watt*%2b*80K*&Dk=1&Ns=SField&N=0&crc
=false

including a pdf description.

From: Keith Densmore
Topic: 2524  Message: 2524

Greetings to All,
I have recently aquired a T-3 and I plan on doing a restoration of it over the rest of the winter. I think I can handle everything on it with the exception of the exciter/rf front panel.
Does anyone re-paint and letter them?
Alternately, does anyone have a redone panel or very good original for sale?

Thanks,
Keith, VE3TS

I believe that TMC uses an 18 K Ohm @ 120W-140W.
I don't believe that I have any in stock unless they are still (very likely) buried in the wharehouse.
I sold my last ones to MR.TMC.....who I will check and see if he is willing to part with one.
If he says, "YES", then I'll cheerfully provide his name to the needy individuals(s).
He collects ONLY TMC stuff, meaning parts, assemblies, etc. So if anyone has TMC items (TECHNICAL MATERIAL CORP), then I would love to know what you have avilable for SALE or TRADE.....
HAPPY NEW YEAR to a GREAT BUNCK of FOLKS.

Bob,

No, it's in TM 11-5820-258-35P, but I've never seen nor heard of a copy.
LOGSA doesn't have it (either).

OK Bob,

I saw that number in front of one of the manuals that I have here. It
mentions that there is a parts section in it. To be referred to as the mystery
manual.

I think some folks are on e-crack this weekend.
There was a $25 antenna adaptor for the R-390 that went for $71 and
a HAL ST-6 that went for over $200 The weekend isn't even over yet!!

See my earlier post for a link to another 6000 listed on the 'bay.
It's up
to over $40 with 6 days to go - sold by the same fellow with the $71
antenna adaptor.

Is there a strange planetary alignment this week that wasn't advertised?

The subject of 6000 subs comes up once or twice a year. The 25AV5 has the same base pinout the as the 6000 and a compatible heater voltage. However, when I plugged one into my Basic about 10 years ago I immediately observed a) "high" plate current, and b) the tube didn't cut off on key-up. Don't remember just how much plate current was flowing in either case but remember being concerned about plate dissipation so I fed the screen off or a WW pot in a voltage divider circuit. Easy mod that gave me a more comfortable operating plate current, allowed for complete cutoff on key-up and still provided sufficient drive to the 4-400 across the rig's frequency range. Mike reports long term, satisfactory results without these mods so T368's may vary in their characteristics one to another. Way back, though, I remember someone else doing this and experiencing reduced tube (25AV5) life. Anyone else have experience here?

The 6000 has an unusual base pinout which limits direct plug in substitutions. A 6AV5 would only require picking up a different heater voltage and if this were done the smaller 6AU5 (same base pinout) might also work. Tight quarters around the 6000 socket on the exciter chassis make major rewiring unattractive, but if one is willing to take on the task, such tubes as the 6BQ6, 2E26, 6146 or and even one of the skinnier versions of the 6L6 would be candidates.

Too bad the 6000 is so scarce. Tough little jug that would be useful in a lot of applications. Anyone ever seen one designed into anything besides the T368?

Joe,

Antique Radio Supply used to handle these on a random basis, not so long ago....

Perhaps it's worth keeping in touch with them on the 6000 from time to time...

you are right mike i use a 25av5 in one of my vfo,it
works fine.i did add the screen pot to reduce the
plate diss of the tube but the tube did the job as
just a plug in replacement .one also use other tubes
with diff fil voltage req with a simple
change in fil supply.any one who pays that kinda money
for a 6000 tube and brags abt it ,deserves getting
s----d,73`s for now bro geo w8qbg.

Dan,

I wouldn't know of anyone that would part out a BC-939, NOR anyone that simply has parts for them.

Try looking at the BC-610 TM and see if you can get enough info to obtain an equivalent or replacement.

I've got two BC-610s and two BC-939s. They will most likely have to be dealt with EITHER after I die OR I finally get too old for this HEAVY stuff. (A young 55 going on 56 in about 4+ months!)

# 2553. BC-610-E Plate current...

Yahoo group: T-368_BC-610
Date: 2006-01-20 19:56:01 UTC
From: Rick Brashear
Topic: 2553  Message: 2553

Hi,

I am in a quandary. I tune my "E" model up to 400 watts in "CW" mode as indicated on a Bird 43 watt meter with a 1K slug. All goes according to the manual except the Plate Current is only 190 ma after resonance is reached. In the TM 11-281 manual it states the Plate Current should be around 250 ma for full output of 400 watts. When I move to "Phone" position the Plate Current is only 160 ma with an output of 310 watts. This is all done with the BC-610 attached to a Heathkit Cantenna 50 ohm dummy load. I have adjusted the plate coil to virtually every possible position to attain the best transfer of power to the load, but still am unable to achieve anything like 250 - 290 ma of Plate Current as the manual suggests. The plate voltage is within 10% of the manual's specification. I have all new tubes which I have substituted several of them to be sure they are all good. The "P.A. Plate" meter is within 1% of the reading I get on my Fluke 189 and it was just calibrated a few weeks ago, so I don't think it's a faulty meter. During neutralization I did get a higher plate current, but once neutralized that went away. Any suggestions? I'm at the point where I want to say "If it ain't broke, don't fix it", but I fear there may be a problem elsewhere and I do not cherish the idea of having to break this monster down again once completely assembled.

Thanks for any advice.

73,
Rick

Yes, but the Air Force didn't exist when the last of the -E's were built.
And even up through the -I's, there's no mention of any blowers in any of the
610 TM's or MWO's. I'd be more inclined to guess that it had been done
commercially for some AM broadcast stations. However, I finally have a TM on AN/MRC-1
inbound. If there's anything in there, I'll post it.

In a message dated 1/21/2006 12:41:16 AM Central Standard Time,

# 2557. REAR AIR VENTS BC-610 TRANSMITTER

Yahoo group: T-368_BC-610
Date: 2006-01-21 09:02:03 UTC
From: W6PSS@aol.com
Topic: 2557  Message: 2557

Gentlemen:
Perhaps I can provided limited information on the subject. In 1962, While stationed at the Master Control Radio Station for Naval Reserve Arlington Virginia (OP-942N Pentagon), we distributed several dozen complete U.S. ARMY SIGNAL CORPS Communications Vans to members of the Naval Reserve nation-wide. The requirements were that each Reservist possess a valid FCC Amateur License and agree to utilize the equipment to check into and operate often in the Wednesday evening National Naval Reserve CW Network (NNRN) at 0500Z. Each van included a BC-610H transmitter.
One collateral duty on this independent assignment was to function as NCS for the NNRN which required a 25 mile commute. The powers that be (LCDR Chuck Winnette) approved
the transfer of this net function to the home QTH using call letters NCR1.
A Navy 30' whip and BC-610H were provided for that purpose. The equipment became my own upon transfer. Yes, it was equipped with a blower and wire dust screen over its rear opening. The blower was a "Squirrel Cage (Impelling unit) bolted to the outside rear cover. Except for the top vent covered also with a wire screen to expel the heated air, the side vents were covered with crude sheet metal covers perhaps to minimize EMI/RFI and maintain adequate flow thus, perhaps, giving better control to a temperature compensating switch near the 250TH final.
Because the retrofit appearance rendered by the side vent covers, I suspicion that they, the blower and temp switch were part of a field change on some of these later models or possibly for this one batch. That's pure speculation.
It was believed the "H" models were contracted circa 1955
FYI:
Nomenclature: BC-610H
Serial: 366
Signal Corps: U.S. Army Order No. 21418-PHILA-50-7-C
MFG: The Hallicrafters Co.
Literature: CMII-281 Packed with equipment applies (Not held)
Good luck! We've got to keep these fine old girls in service for compelling reasons too lengthy for this email.
73,
david

# 2558. Re: [T-368_BC-610] BC-610-E Plate current...

Yahoo group: T-368_BC-610
Date: 2006-01-21 03:05:23 UTC
From: James M. Walker
Topic: 2553  Message: 2558

Hi Rick,
Sorry about the problem. Seems however to leave some questions, so
I will jump in here and say first, the cantenna is NOT a very good load
for the BC-610, be that as it may. What is the reflected power from
the cantenna. If it is significant then the cantenna is changing impedance,
and NOT providing a 50 ohm load to the rig.

2KV @ 190 MA = 380 watts, what is your Plate HV reading actually.

My unit with 2KV @ 200 MA read 400 watts into the ME-165, with
0 reflected watts, there will be differences in readings from unit to unit.
I can load the rig to 250 MA into a 50 ohm load but no more at any
adjustment of the swinging link.

As you say if it works don't fix it, but make sure it isn't trying to handle
excessive amounts of reflected power.

YMMV
Jim

# 2559. Re: [T-368_BC-610] BC-610-E Plate current...

Yahoo group: T-368_BC-610
Date: 2006-01-21 16:28:05 UTC
From: Keith Densmore
Topic: 2553  Message: 2559

Low output of any final amplifier can be the result of any of the following. This assumes the tubes are good. Methodically check each reading until the offending culprit is found. I don't own a BC-610 but this guide should work for just about any PA.

SWR/Mismatch/Neutrilization (already suggested).
Low plate voltage. (Already checked)
Low screen voltage at the tube.
Bias too high on the control grid.
Insufficient drive to the control grid.
Unwanted resistance in the cathode circuit. (If applicable).
Low filament voltage.

Hope this helps,
Keith, VE3TS

Rick,
here's a question for you, did you mention you have plate current when neutralizing the rig?

Next is BIAS, the question is where is the bias voltage reading?

Remember you have to set the bias voltage to the 250TH after you set the filament voltage meter to 5.0 - 5.3 volts, this sets the ac input to the bias supply as well. Then set the bias to the 250TH. It can be a little tricky.

Then Neutralization is done in the 6 - 8 Mhz range, manual says at the high end of that range. No HV on the unit during adjustments.

Oh and 2475 seems high, what is your main AC input 125 or there abouts?
Note if this is an "E" model there is no facility to restrap the transformers for
a higher AC input, a variac is definitely indicated here for the main AC input.
Don't want to lose transformers.

David,

According to the Signal Corps Order Number you quoted, the order was placed in Fiscal Year 1950. That would be Calendar Year 01 July 1949 to 20 June 1950. From the sequence number (21418), I'd guess toward the end of the FY. Of course, the -50- doesn't tell you when the transmitter was actually built and delivered, but it was probably during CY 1950.

# 2563. FS: Two Straight Keys

Yahoo group: T-368_BC-610
Date: 2006-01-21 14:28:04 UTC
From: Brian Carling
Topic: 2563  Message: 2563

FOR SALE: Two Straight Keys.

The first key is a J-37 in excellent shape, all complete and
mounted on a type J-47 base. Available for $35.00 plus shipping.

The second is a generic straight key with shorting bar.
Also in great shape. Available for $25.00 plus shipping.

Pictures and details at:
http://www.af4k.com/miscpart.htm

# 2565. T 368C unkeying problem

Yahoo group: T-368_BC-610
Date: 2006-01-22 04:57:49 UTC
From: Joe Munson
Topic: 2565  Message: 2565

Hi Group,

Well thanks to a suggestions from Tom Laird, my T 368C is back on the air with full power. The popping of the breakers when unkeying was due to the most part, a bad 5933/807W, the clamp tube. This tube tested FB, in a TV-7D, but must have broke down with the 600 or so volts of screenvoltage on the plate of the tube. While I had the beast pulled where I could get to it, a good dusting and cleaning of the insulators, interlocks, switches was performed. As far as I can tell, the unit is back up to 100 percent. Still looking for an extra speech amp deck to modify. I am still running a stock one, with no mods and usually run it with the carbon mic. I have built up a circuit to use a D 104, to just hook into the carbon mic input, getting its power form the Mic Bias voltage. Will be trying this circuit in the future.

Joe Munson

# 2567. BC-939-A

Yahoo group: T-368_BC-610
Date: 2006-01-26 04:22:31 UTC
From: Rick Brashear
Topic: 2567  Message: 2567

I need a little help with my BC-939-A antenna tuner. There is a small terminal or connector (mine is missing) on the top of the cabinet near the back of the tuner. Can someone in the know or someone with one of these tuners for their BC-610, please, take a look and tell me if that connection is insulated from the cabinet and if so, how? It attaches to a bar inside the cabinet which in turn contacts a spring like connection on the output coil. The bar is insulated from the cabinet at the spring contact.

Thanks for any help.

Rick

Ola Rick es List,
That is a thumbscrew terminal and it is the connection for
the ground coming from the BC-939(*), goes to the chassis
of the vehicle if mobile and using a whip, or to a ground
stake "in the ground" if in a fixed operation. It has a specific
name (for the type of terminal) suffering from CRS and I can't
think of it off hand. It is necessary however whether mobile
or fixed operation is contemplated.

Hi James and all...

Thanks for the info and the pictures. I'm sorry to be so dense, but
does the thumbscrew terminal actually ground to the cabinet?

Rick

Yep,
If you turn the cover over you will see a long silver coated
bar that runs towards the front of the unit. It makes contact
with the input coil of the unit L5 in the manual.

# 2571. BC-939-A Mounts

Yahoo group: T-368_BC-610
Date: 2006-01-26 20:54:28 UTC
From: Rick Brashear
Topic: 2571  Message: 2571

Does anyone happen to have available for sell or trade four (4)
mountings for a BC-939-A to BC-610-E? The restoration is finally
getting close!

Thanks,
Rick
K5IZ

# 2572. Re: [T-368_BC-610] BC-939-A Mounts

Yahoo group: T-368_BC-610
Date: 2006-01-27 14:20:40 UTC
From: James M. Walker
Topic: 2571  Message: 2572

Rick and group,
the mounts for the BC-939(*) to the BC-610(*)
can be had by acquiring 4 (four) each 10-32 hex stand-offs 2 inch,
and 10-32 X 3 screws, and 10-32 wing-nuts. Flat washers on the
inside of the top cover of the BC-610, and also under the wing
nuts total = 8 (eight).

From: Brian Carling
Topic: 2573  Message: 2573

REDUCED:
Amperite Time Delay Relays - New In Box.

All are new and in the boxes.
26NO60T (9-pin mini base, 24-28V, 60 sec.)
QTY 3 - $2.00 each or....
BUY ALL THREE FOR $3.00 PLUS SHIPPING!!

115NO2 = 2 seconds, normally open contact.
(octal socket, 115-120V) - 1 left - Available for
$5.00

BUY all 4 of the above relays for $6.00
plus $5 for shipping.

# 2574. BC-610-E RF deck interlock switches mounting?

Yahoo group: T-368_BC-610
Date: 2006-02-01 16:41:13 UTC
From: g3vkm
Topic: 2574  Message: 2574

Hi All,

I posted this a while ago but still need the info. My '610-E has no interlock switches fitted on the RF deck. I got a pair of switches and their actuators with the rig but I'm not sure if they are the original type as the actuators don't seem to align with existing holes in the lids plus I can't see anywhere on the RF deck the switches would mount.

I'd be really grateful if someone with a 610-E take a few photos for me of the fittings in place.

73,

Roger/G3VKM

# 2575. WTD: BC-610-E Parts

Yahoo group: T-368_BC-610
Date: 2006-02-01 16:59:29 UTC
From: g3vkm
Topic: 2575  Message: 2575

Hi All,

Following parts wanted for my '610-E restoration:-

1) PA coils - I need C-388A (covers 3.5 to 4.5 Mc).

2)A BC-610-E front panel nameplate, ideally Hallicrafters.

3) For the BC-614-E speech amp, 0-300ma DC panel meter, 2.8" case size, square face, four hole mounting.

4)For the BC-939 antenna tuner, a 0-15 Amp RF thermocouple meter, type GE DO-53, round body, 2.8" dia. case, either three or four hole mounting. A meter with a duff thermo-couple might do provided the movement is good.

5)A pair of working solid-state rectifiers to replace the 866A mercury-vapour valves in the HV supply. (Or hints on how to roll your own).

6)600W heater element for '610 PSU

I have several good condition TU units and coils for swaps or will buy outright parts above, PayPal available.

73,

Roger/G3VKM - Norfolk, UK.

Is there a manual specifically for this tuner? I only find a 1.5 - 2 mhz modification in my T 368 manual which is missing some parts.

Does anyone know the range of loads it will match in the three positions, as is?

Thanks,
Fred k2dx

From: James M. Walker
Topic: 2578  Message: 2579

Howdy,
It is NOT a matcher, it is a Coupler, firstly. The BC-939(*) is generally
used with a 15 foot whip, in mobile operation, or a 44 foot wire end fed.
The portions of the manuals for the T-368 and also the BC-610, show
the schematic for the three positions you speak of.
If you go to my site, you can get themanuals for the BC-610, and T-368
that show the schematic for the BC-939(*) units.

It actually presents a 50 ohm load to the transmitter, and inserts
inductance
and capacitance in the circuits selected to the antenna to allow a maximum
transfer of RF current to the antenna.

OK looking, however way over the top on price. Where are these
people from?

Interlocks missing, power cable smallish, and connector missing. 100THs
missing, try 300.00 plus shipping and insurance from N.J. for returnable
if damaged tubes.

Cover missing from modulator relay. 1 plate coil but loads of tuning units.
rear cover missing, or maybe not!

"Don't know the operational state. BEST OFFER 600.00 for all shown.

YMMV

Naw, the color scheme, changed depending on which organization
was using it and subsequently refurbished it. Some folks in MARS program got
them
also, and the schemes there could range from O.D. to sky blue and
whatever between.

I got one from a former MARS guy once, an (I) model it was Birds Egg Blue!
Ghastly color, hurt the eyes to look at for too long :-)

Topic: 2577  Message: 2585

Don't know if you all looked at the non-typical tech plate attached to it. This unit appears to be a piece of gear that was to be traced for lifetime determination. That is, a unit designated to be the reference unit for the "fleet". I've been involved throughout the years in life-extension and life-cycle of electronic systems, but I've never seen this tag before... Very interesting. At least one can assume that this was one of the, if not the, last one to go from the regular inventory... at least for the Army. Of course, the program may well have been scrapped along the way. $1500??? Don't hardly think so!

# 2586. Cables... BC-614-C to BC-342 or BC-312

Yahoo group: T-368_BC-610
Date: 2006-02-06 21:21:51 UTC
From: Rick Brashear
Topic: 2586  Message: 2586

I've searched numerous manuals and schematics and have been unable to find a "DC" source in the BC-342/312 receiver for the antenna relay (RY101) in the BC-614-C. The manual states RY101 is a 12 volt "DC" relay and it derives its power from the BC-342 or BC-312 receiver. I can find a 12 volt AC source that connects to the BC-614-C, but no DC. I am probably over looking something, but what?

I have also been unable to find a wiring diagram of the cable used to attach the speech amplifier and receivers. I can be figure it out from the schematics, but if anyone knows the pin out or has a diagram it would sure be easier.

Thanks,
Rick/K5IZ

Rick,

It actually goes the other way, i.e., the 614 "feeds" 12 vdc through RY101 to the receivers to mute them. Primary DC source was the 12 volt battery included as part of the SCR-299 system and fed into the 614 via SO-103. (This battery also powered the BC-312.)

>
In the SCR-299 everything on the table was interconnected through the wiring channel that ran underneath. For the BC-312, cord CD-545 connected SO-1 on the receiver to SO-201 on the wiring channel. For the BC-342, cords CD-564 (115vac) and CD-566 ran down to the channel. On the
BC-614, the receiver control lines came out of SO-103 down to the channel via the "Operating Control" cord (no number given in my book). Transmitter control, in turn, came out through SO-104 which did not run through the table channel.

Did you plan to connect up your receiver(s) directly or are you trying to simulate the original table setup? If the former, working out the 614 to receiver wiring and pin-outs directly from the schematics would be easier than tracing through the original box-through-channel-to-box diagrams.

Hope this helps.

From: Rick Brashear
Topic: 2586  Message: 2588

Thanks Dennis, it does help, however, I'm still fuzzy on where the power for relay RY101 is derived. I know once RY101 is energized it sends the voltage to the receiver to activate the muting sequence for the receiver, but the manual says RY101 gets its 12 VDC from the receiver and is fed to pin 6 on SO103 of the 614. Does the same battery supply both? On the BC-342 schematic there is 12 VAC at terminal "J" (I think I'm right about the letter) of the inner connection socket and I can't find where it would be necessary. Needless to say, I am confused. However, the way I understand it now is the relays in both the speech amplifier and the receivers are or were powered by battery, even in the BC-342 AC model.

My intention is to simulate the original table setup, so I guess tracing the wires will not be too difficult if I can just get this relay thing clear in my feeble brain. Getting old has its advantages, I just don't know what they are!

Thanks,
Rick/K5IZ

Rick,

The 12 VDC ultimately came from the 12 volt source that ran the BC-312.
Either the standalone battery in the shelter, the 12 volt vehicular system, or the
starting battery on the PE-95.

Rick,

Think of the channel as a long, skinny junction box. My TM (1-280, June 1943) shows +12 V coming into the channel with an arrow pointing to the words "12 volt battery." The 12 volts likely could be switched in form other sources as Robert pointed out.

As I look at the BC-614-C schematic it does appear that +12 would come in through SO-103, pin 6 and my manual sez so in the narrative section. Looking at the BC-312 and 342 diagrams, I see no way the +12 could be passing THROUGH the receivers to the 314 and find no mention of narrative in this regard. Also, there are only 4 wires in the cord going to the BC-312 (+12 in, S/R relay, B- and common gnd). The BC-342 cord only has 3 wires (B-, S/R relay and common gnd.). The B- connection is a bit of a mystery since the continuity tables show this pin on receiver mating plug as always being grounded. BTW, pin J on the front panel connector (SO-1) of both the BC-312 and 342 goes to the S/R relay. The application of +12 volts here mutes the receivers but only when the "Send/Rec." switch on the front panel is on "Send."

I would surmise that the +12 volts gets fanned out in the channel going to both the 312 and 314 (and maybe elsewhere).

# 2592. FS: Capacitor Checker, Sub Box and VHF Wattmeter

Yahoo group: T-368_BC-610
Date: 2006-02-08 12:25:48 UTC
From: Brian Carling
Topic: 2592  Message: 2592

FOR SALE: SEMCON RC115 CAPACITANCE / IMPEDANCE METER - very nice. This is a combined Capacitor Analyzer, impedance bridge and transformer analyzer. This is the most comprehensive capacitor analyzer I have ever seen. Checks capacitor value, leakage etc. at up to 600 Volts DC. It is also an impedance meter. Analyzes transformers. Measures POWER FACTOR, etc. etc. Also works as a megger to check insulation resistance. Excellent working condition. For 120V AC 60 Hz operation. Available for $59.00 plus shipping.
CORNELL-DUBILIER CDA-5 Decade Capacitance Box. - excellent
This substitution box is in a beautiful bakelilte case, and it covers 0.0001 uF to 0.0199 uF.
All capacitance setting rated for up to 600V DC. A great addition to any shack or experimenter's lab. Excellent condition.
Available for $20.00 plus shipping. ME-82/U Wattmeter and Dummy Load VHF-UHF, military surplus. Measures power from 50 to 600 MHz. Load is 52 ohms. Meter movement is the same as on Jones Micromatch equipment. Wattmeter scale shows RF power in the range of 0 - 120 Watts. Has Type N connector. Handy carrying handle swings out of the top. Has large heatsink. Excellent working condition. Available for $45.00 plus shipping. Pictures and details at: http://www.af4k.com/testgear.htm

Wellllll,
Not exactly, although the premise is there. I use and used the following, the O-39
FSK generator, if you don't transmit FSK with it it is just a frequency controller.

I also used the BC-221 through the HP-8447 amplifier to drive the XTAL socket
of the tuning units.

I also used the PTS (mfg) 040, and the signal source have to turn the output down
on the PTS to just off of zero on the front panel PTS meter.

On all occassions you must remember the XTAL freq input to the tuning unit starts at 2 Mhz and goes to 6 Mhz. The position doubles or triples in the tuning unit.
The manual for the PTS is available from PTS a description of them is on my web pages. The manual for the O-39 is TM 11-257. I may have an electronic copy of the BC-221 manual but suffering from "CRS" so I am not sure.

Thanks Jim. That's great info. I only wish I had the O-39 FSK
Generator to use. I've been looking a long time, but so far nothing.

I'm glad to know I'm not the only one with the CRS Syndrome!

From: g3vkm
Topic: 2597  Message: 2597

Hi,

Looking for a source of new or used catches for the BC-610 coil and tuning unit lids, mine are missing. Have scoured the web sites of a lot of hardware stores without success!

Also looking for the top cover screwed rod(?), spacers and wing nuts, all I can locate over here is similar stuff in metric sizes.

73,

Roger/G3VKM

Hello.

I'm looking for a spare T368 speech amplifier chassis in pretty much any condition to use in constructing a modified version. Hopefully it will have a driver transformer but that isn't a requirement. My present one is too nice for 'invasive surgery'.

Anybody have one laying around?

Fred k2dx

# 2600. BC-610 HV Rectifier Mountings?

Yahoo group: T-368_BC-610
Date: 2006-02-19 18:53:32 UTC
From: g3vkm
Topic: 2600  Message: 2600

Hi All,

In one or two web photos I've seen of the BC-610 HV PSU the two 866 rectifier bases are mounted above the chassis on a small platform, whereas the various manuals I have here show them with the bases under the chassis, and indeed that is how my BC-610-E is built. Is this a later mod or something that has been done in amateur service? I assume the reason may be to avoid damage to the bases when below the chassis or possibly to improve isolation of the HV wiring from ground?

73.

Roger/G3VKM

# 2601. Re: [T-368_BC-610] BC-610 HV Rectifier Mountings?

Yahoo group: T-368_BC-610

From: Rick Brashear
Topic: 2600  Message: 2601

Hi Roger,

This was an optional update issued by the Signal Corps (I think) that is documented in at least one of my manuals. The reason given is to help prevent dirt and crude from settling into the 866 sockets due to them being mounted below the chassis. My "E" model already had this modification in place, but had it not I would likely have done it myself.

Hope this helps. I'll check and see which manual it's in.

HIGH VOLTAGE CAPACITORS FOR RF AMPLIFIERS etc.

Sangamo silver mica 0.001 uF at 2500V DC.
Large quantity of these brand new capacitors
Use for RF finals and linear amplifiers
I have plenty of these available at $4.00 each.
Buy 10 or more for $3.00 each. Shipping
additional.

NEW MALLORY AND RCA 10% TOL. CERAMIC CAPACITORS AS
FOLLOWS:
QTY 6 - 15 pF at 3000V DC
QTY 5 - 15 pF at 6000V DC
QTY 2 - 22 pF at 3000V DC
QTY 1 - 22 pF at 6000V DC
QTY 3 - 27 pF at 3000V DC
QTY 6 - 33 pF at 3000V DC
QTY 2 - 33 pF at 5000V DC
QTY 3 - 33 pF at 6000V DC
QTY 5 - 39 pF at 3000V DC
QTY 7 - 47 pF at 6000V DC
QTY 10 - 56 pF at 6000V DC
QTY 1 - 68 pF at 6000V DC
QTY 2 - 82 pF at 5000V DC
QTY 6 - 82 pF at 6000V DC
QTY 6 - 100 pF at 5000V DC
QTY 10 - 100 pF at 6000V DC
QTY 9 - 130 pF at 6000V DC
QTY 4 - 150 pF at 5000V DC
QTY 14 - 150 pF at 6000V DC
QTY 2 - 180 pF at 6000V DC
QTY 10 - 200 pF at 5000V DC
QTY 3 - 270 pF at 3000V DC
QTY 3 - 330 pF at 6000V DC
QTY 3 - 390 pF at 3000V DC
QTY 1 - 560 pF at 3000V DC
QTY 1 - 560 pF at 6000V DC
QTY 6 - 750 pF at 3000V DC
QTY 5 - 750 pF at 6000V DC
QTY 2 - 820 pF at 3000V DC

The above caps are all brand new and are $3.00
each.
For quantity of ten or more they are $2.50 each.
For 20 or more pay $2.00 each. Shipping
additional.

E-mail me to arrange purchase.

From: Mark Foltarz
Topic: 2604  Message: 2604

Lets just say that I know someone...

He is considering selling a BC-610-E in physically excellent condition.

Manufacturer is Hallicrafters. Almost ready to put on air.

Has BC-939, BC-614, JB-70, tuning units, some rocks, original TM, coil set,
spare pair 100th and 250th.

Also extra modulator deck.

Located in N.E. Ohio

What would such a package bring?

tnx

de KA4JVY

Mark

From: James M. Walker
Topic: 2604  Message: 2605

Hum,
I would think it would depend on the buyer, really! Sometimes a person wants to rebuild a partial unit, and looks for a semi-complete unit to get the original parts from.

A good point of reference would probably be, to determine if the unit was on the air recently (past 3 - 5 years), was it dumped because a major component failed, if so which one! Do the extra items with the unit work are they complete? Reasoning there is, for example the BC-939 might be better put on e-bay to recover a higher price. Same for the BC-614. The JB-70s are scarce, so that alone MIGHT bring more than the BC-610-E.

Lots of folks say the have a complete "coil set" which in most cases means they have coils for 80/40/20, in various states of repair. Tubes, lets NOT talk
about tubes, yes they are usually there, and mostly they are whatever was found
that goes there to try to fill the chassis. 100TH are fragile and expensive, 250TH
tubes are expensive depending on what you will accept.

Cest qui se, extra modulator deck? From what version of the transmitter? Again is the mod iron good or are we talking, a paper weight for the CW logs?
In purchasing modulation iron it isn't really the asking price for said iron, but the
pickup/shipping costs for it.

Physically excellent condition? Does that mean no bullet holes? Not being mean here
just trying to give you an idea of the thing I have run into. as in the following
description..

One BC-610(I) complete, with all the coils, worked great about 10 years ago can't remember why I stopped using it.

Failed to mention the exciter section was removed and he was using an HT-37 to drive the 250TH directly and it never worked that way. Also the modulator deck was complete with burned out mod transformer and driver transformer due to the 2A3s being ripped out and replaced by triode connected 6L6s, which he also never quite got working!

However, I think it depends on the buyer really as to the value they place on it,
and also whether pickup is available and distances that must be traveled.

A good rule of thumb is if it doesn't work, separate the pieces, check for
their
physical completeness as much as possible, a sell they accordingly, try to
be
accurate in your descriptions.

If I were considering this one , I would (from the description) be expecting
to find the coveted 160 meter RF palte coil, but NO tuning units as they are
not mentioned, I would also expect qty (2) two spare 250TH tubes and one in
the unit.

FWIW
YMMV
Jim

# 2606. Re: [T-368_BC-610] Fair market value

Yahoo group: T-368_BC-610
Date: 2006-03-06 02:53:14 UTC
From: w4awm@aol.com
Topic: 2604  Message: 2606

Hi Mark,

At the FARFest in Gaithersburg, MD, last fall, there was a similar rig with similar accessoried, except fot the spare tubes and the 250TH was missing. It had spent it's whole life in a lab powering some kind of industrial heater. Outside of some dust and a few very minor scratches, it was at least a 9! The seller was asking $500 for the works, including delivery within a resonable area. I really wanted that thing, but there was absolutely nowhere I could put it.

He wanted to sell it to a ham who would put it on the air and I tried to interest some friends, all of whom have similar space problems. Finally, it was sold to one of the local sleeze tube dealers who the seller didn't know. When he was told, he was sick and tried every way to get it back. Three weeks later, it was on the infamous auction site with a starting bid of $1500.00. At least the guy put a final in it, but it got no bids. I am sure a lot of folks were happy about that. I don't know what happened to it, but it will probably wind up back at auction again in the future. I don't think the seller has a ticket.

I would say that $700.00 more or less, in light of all the spares, is not unreasonable. The big problem is moving the beast. It may have handles but it sure ain't portable!

73,

John, W4AWM

Hi Mark -

Just my 2¢ worth: last fall I picked up a decent BC-610E model from a friend with no accessories, all tubes, some coils, and the two installed tuning units. Some minor mods, reversible for the most part. I paid $350 and figured it was a fair deal. It powers up, but I haven't gotten much further. My guess would be at least $500, probably more. The tubes alone are worth a fair amount if you buy them from a tube dealer. Maybe $200-$300 retail for a 250TH and pair of 100THs (which explains why so many of us like hamfests and yard sales!).

Of course, hamfest deals, items found in barns, etc would skew the final overall figures, but $500-$700 seems like a fair price if all is indeed as represented. Epay price would likely be a lot higher, but I don't factor that in as it's more the exception than the rule. As Jim says, a lot of other things figure in to the equation.

Good luck with it, hope you get it.

# 2608. FS: Audio transformers 600 ohm to 600 ohm

Yahoo group: T-368_BC-610
Date: 2006-03-10 13:12:47 UTC
From: Brian Carling
Topic: 2608  Message: 2608

For sale:

Audio Transformers - 600 ohms to 600 ohms

For these 600 ohm to 600 ohm transformers -
I have two types. They are both black
and potted as shown in the pictures.
The larger ones are rated 1 watt from 250 to 6000
Hz response.
The smaller ones are rated 0.5 watt and 300 - 3500
Hz response.

Dimensions are 1.5" X 1.5" X 1" for the larger
ones.
Dimensions are 1.125" X 1.825" X 0.75" for the
smaller ones.
I have several of each available.

The smaller ones are available for $15.00
The larger ones are available for $12.00
Shipping additional.

Pictures and details at:
http://www.af4k.com/xfmrs.htm

# 2609. JB-70-A

Yahoo group: T-368_BC-610
Date: 2006-03-11 21:26:37 UTC
From: Rick Brashear
Topic: 1985  Message: 2609

I need some guidance as to how the JB-70 handles the PTT switching for the BC-614-E/BC-610-E. Pin #4 of SO-102 in the BC-614-E goes to pin #2 of SO-101 which is the microphone PTT socket. When attached to the JB-70 where does pin #4 go? Is it simply attached to a relay that grounds the connection to accomplish the PTT? If so, without using a JB-70, can I install a switch between ground and pin #4 of SO-102 on the BC-614-E to have the same thing? Since I will not be using the side tone at this time the only other difference I see between connecting the microphone to the JB-70 or the 614 is one 25K ohm resistor, R105, which I am assuming facilitates a better match for the JB-70. Am I missing something here? ...which would definitely not be out of the ordinary! Does anything happen to the microphone signal inside the JB-70 before it returns to the speech amplifier?

Thanks for any help, advice or clarification.
Rick/K5IZ

# 2613. BC-610 relay RY-5

Yahoo group: T-368_BC-610
Date: 2006-03-17 01:51:19 UTC
From: Rick Brashear
Topic: 2613  Message: 2613

Hi all,

My BC-610-E has a pretty bad "talk back" problem that I am assuming is coming from RY-5, the overload relay. I have read I can put a 100 - 200 uf @ 20vdc or more electrolytic across this relay and eliminate the problem. It sounds logical and I can see how that would bleed off any audio getting into the relay. Has anyone here used this method or know of anyone who has? It's a task to get this old girl away from the wall and opened up, so I'd really like to hear first hand of any experiences before I call it cured. Also, since the relay is in the return circuit (center tap of the power transformer) my thinking is the positive side of the capacitor should be grounded. Am I thinking correctly?

Thanks for any and all help.
Rick/K5IZ

From: James M. Walker
Topic: 2613  Message: 2614

Well,
I am not sure of other folks, but I have never experienced this
"Talk back" phenomenon! However the reason for me not experiencing
it might be due to way back when I got the "E" model in Germany
it came to me with no relay there, I ordered a new one, came wrapped in
soft brown packing material, inside a metal can, had to use a P-38 to
open the can. Popped it in put star washers (included) under the screws
also (included) no talk back. I recently refurbished the BC-610(E)
power supply chassis, relay was just fine, as is the rectangular cover
that goes over it. I might mention also the cover has a rubber coating
inside.

When I got my BC-610(I) model the relay contacts were welded together,
don't know why, so I just replaced the relay again, also the relay cover
for that one is rubber lined as well. I have to think that the
talk back noise is a result of either A) the relay is not mounted correctly
or B) the cover for all the relays there is missing.
YMMV

Hi Jim,

Thanks for the reply. I must admit, the cover for the overload relay is
missing. Do you think that could be the entirety of the problem? It is
a considerable feedback.

Thanks,

Hi Rick
I have my speech amp across the room because of the original problem. The oil cap cured what was left of the annoying talkback.
Feedback is another problem. Might be a ground loop, bad shield, open ground, microphonic tube(s) - lots of things.
If you safely and temporarily jump out the current relay and the talkback stops - that is the culprit.
Be careful,
bob...w2ami

Thanks Bob. Unfortunately, I must have bigger problems than I thought. I installed a 100 uf capacitor across the relay (RY-5) and it may have helped a little, but not nearly enough. I am still unable to reach a decent audio level without feedback from somewhere. Do you think the missing cover over the relay(s) would have that much to do with it? It seems the feedback is coming from the modulation transformer itself. All voltages are correct and the modulator bias is set correctly. It's a real head scratcher at this point.

Do you want to make the connection directly into SO-200 on the JB-70 control box or do you want to come in on the bumper connector on the end of cord CO--335? Could be the same connector, I can't tell from the documentation I have which doesn't provide part numbers. Your 399 appears to be rather complete so if you could provide identifying numbers (typically PL-(***)) for the plug on the end of cord CO-316 from the PE-95 and/or the plug on the end of cord CO-335 that mates with SO-200 on JB-70 this would be helpful.

# 2620. Re: [AMRadio] BC-610 Modulator feedback - and notes

Yahoo group: T-368_BC-610
Date: 2006-03-18 14:30:03 UTC
From: Rbethman
Topic: 2620  Message: 2620

Rick,

Additionally, there should be NO shield on the 2A3s. The entire transmitter was designed to function with CONVECTION or OPEN air cooling.

There is only ONE tube that has a "shield". It is the oscillator deck 6L6. It SHOULD be a metal jacketed tube.

The 1/4 X 20 bolts on top of BC-610(X)s were intended for the mounting of the BC-939(X) antenna tuners. Since the BC-614(X) speech amp is fully enclosed w/o vents, I, for one, would be very hesitant to use it on top of the BC-610(X). All the heat from below would add to the heat inside the speech amp. The components "probably" weren't designed for THAT additional heat. The BC-614(X) has a long enough connecting cable to place it on the operating bench.

Pay close attention to WB2FCN, Jim! He restored my first one. He has "carnal" knowledge of these BEASTS and has helped MANY get them up and going.

I've also resent this to INCLUDE the T-368 BC-610 group, WHICH, you may wish to join Rick.

# 2621. T 368 tube clamps

Yahoo group: T-368_BC-610
Date: 2006-03-18 16:39:35 UTC
From: fxdc92
Topic: 2621  Message: 2621

I'm looking for the following hold down clamps for my T368:

Qty needed: For:
(2) 4-125 modulators

(1) HV rectifier

(1) K7 time delay relay

Anyone have extras in the junkbox? I don't need the attaching screws, just the actual clamps.

Regards,
Fred k2dx

# 2622. BC-610 Saga continues

Yahoo group: T-368_BC-610
Date: 2006-03-18 21:43:12 UTC
From: Rick Brashear
Topic: 2622  Message: 2622

Jim and all....

Well, Jim I think you are onto the problem albeit indirectly. The bias supply voltage was a little high, but not enough to be too concerned with. I should have 300 volts on the plates of the 2A3 tubes in relation to the filament and I have 317 volts. My grid bias should be -60 volts in relation to the filament and it is -63.5 volts. So, it is a tad bit high. However, so is my line voltage, at 121 vac. So, I put a heavy Variac in line and brought the line voltage down to 115 volts, then the voltages were where they belong and it helped the feedback considerably and I still had more than ample audio. It still has feedback, but I tightened the old "E" model modulation transformer laminations down a little better and I hope that along with the proper voltages on the 2A3 drivers will make it workable.

I have another thought. The grid bias for the 2A3's is derived from the negative side of a R20, a 750 ohm resistor, through the center tap of a transformer (can't remember its number now) and the resistor is bypassed by a 40 uf electrolytic. The manual states in the later models this capacitor was removed and the results were better linearity. Can you give me your thoughts on this? Did you leave the capacitor in yours?

Thanks so much for your continued help. Thanks to everyone who has advised and assisted me with this monster.

Rick/K5IZ

# 2623. T-368 Parts Needed

Yahoo group: T-368_BC-610
Date: 2006-03-19 19:50:54 UTC
From: Keith Densmore
Topic: 2623  Message: 2623

Greetings to All,
Have started the overhaul of a T-368 rig. I could use the following pieces if anyone has them, please let me know--

The front panel of the exciter unit --this is the sub panel on the RF deck that contains the bandswitch and VFO window.

2 front securing bolts used to hold the decks in place.

Thanks,
Keith, ve3ts

# 2624. BC-610 Coils

Yahoo group: T-368_BC-610
Date: 2006-03-20 01:18:57 UTC
From: Rick Brashear
Topic: 2624  Message: 2624

I have read a few articles on restoring and/or building the tank coils for a BC-610. I have several coils, but most are in bad need of repair or rebuild. I have one that has gobs of some kind of adhesive holding down the windings, it won't load properly. My best 75 meter coil is lose on all fronts and I have to walk softly to keep from detuning the transmitter. Does anyone here have first hand experience with doing this? What is the best material to use?

Thanks,
Rick/K5IZ

# 2626. carbon resistor question

Yahoo group: T-368_BC-610
Date: 2006-03-22 00:43:15 UTC
From: kd1yt@pshift.com
Topic: 2626  Message: 2626

Hello all-- please indulge this question that is only indirectly-related to my T-368E, but I know that members of this group can either give me some wisdom or point me in the right direction

I am the lucky owner of several really nice boatanchor HF recievers of which I'm the 2nd or 3rd owner and these units have very few apparent actual hours of operation (they came out of storage, labs, etc). Like My T-3, I acquired them some years back & they have been awaiting other parts of my life to settle down so that I can get them 100% checked, up and on the air.

When I de-mothball them I know that I am going to have to check them out for capacitors (both electrolytic and paper) that are inherently at risk of being leaky simply from the passage of time. I also know that old carbon resistors are notorious for going out of spec. My question is this: do carbon resistors go out of spec primarily because when used for a lot of hours they slowly "bake" themselves to a different resistance (I know I have seen instances of this in devices with a lot of operating hours on them) or are they prone to going permanently out of spec even when sitting dormant?

I know that with electrolytics and even certain paper caps in critical locations in circuits, I'd be playing a form of russian roulette to not check each one and/ or simply yank & replace them all as a preventative measure. But with the carbon resistors in low-hour sets, how much can I try the "if it ain't broke don't fix it" approach without at the same time ending up with receivers that look nice and seem to work OK-- but don't perform up to their potential & original capabilities.

Thanks & 73
Trevor
KD1YT

FOR SALE:

BC610 Tuning Unit model TU51. Very good condition.
Has the original knobs. There are
no modifications.
Everything looks to be in very good shape
inside and out.
Has crystal socket, and also covers 5.0
to 6.35 MHz.
Before anyone asks, no I don't have any of the others!

For picture and details see:
http://www.af4k.com/radios.htm

Available for $35.00 plus shipping

# 2628. BC-610-H

Yahoo group: T-368_BC-610
Date: 2006-03-24 16:03:00 UTC
From: Rick Brashear
Topic: 2628  Message: 2628

I have a puzzler... on the modulator deck of my "H" model BC-610, surrounding transformer T-7, are three holes where something with a hexed shape has been mounted. The holes do not appear to be modifications as the fungicide treatment is inside them. All of the surrounding components, T-7 included, are stock. The holes do not show up in any manual I have nor on the chassis of the BC-610 "I" model. They are in a triangular pattern and it is possible they had some kind of stand off mounted in them. They are about 3" apart. This is also where the 2A3's and the 5Z3 are and they could possibly have been used to mount some kind of tube restraint. What ever was there is obviously not necessary for operation, it's just something that bugs me. Any ideas?

73,
Rick/K5IZ

Topic: 2628  Message: 2629

Thanks Bob! Obviously, at one time or another, mine had the hold down pieces in place as there are still marks where the spacers or what ever they used were attached. I appreciate the info, it was driving me crazy trying to figure out why they are there. On my "E" model most of the tubes have clamps at the base to hold them securely. For sure they needed them when in the SCR-299/399 scenario! That had to be a rough ride.

Thanks again...
Rick/K5IZ

Rick,

I have them on my BC-610(I). The difference is that IN THOSE HOLES are vertical metal rods that are threaded on the top section.

There is one, (1), adjacent to EACH 2A3, and there is one, (1) adjacent to the 5Z3.

These were intended to have a "hold-down" piece attached to keep the tubes in place.

Remember, these BEASTS were mobile mounted, first series in a panel truck, then later in the communications box that was bolted onto the frame of trucks like 2 1/2 ton or such.

The bumping around, as in the Korean War, was NOT on paved roads. The took a LOT of jarring around.

The safety interlock switch (SW-5) on the back of my BC-610 "H" is missing. The manual, TM 11-826, does not give a manufacturer or even size description of the switch. It's a bakelite encased, SPST, momentary contact, normally open switch. Does anyone happen to have a manufacturers part number or an idea of where I might locate one of these rascals? I could use something else, but I prefer to use original "type" equipment if at all possible.

Thanks,
Rick/K5IZ

The 600 VDC ones will work just fine in most cases, as long as you
haven't upped the the voltages to the 807s etc and they should be OK.

Date: 2006-03-28 13:28:40 UTC
From: Stephen Keith
Topic: 2637  Message: 2637

I am putting together an SCR299. I have most of the big parts; K51 truck, K52 trailer, PE95 genset, BC610, the two radios, etc. I need the following:

JB-69A Junction Box

CO-315 45" cable Jbox to conn
CO-316 100" cable genset to conn

BC-731 Control Box

SW-199A start/stop control box for genset

CH-88 chest on the wall for parts

CH-89 chest you sit on for parts

J45 Key

JB-60 Junction Box telco

CH-112 chest in the trailer

If you had the table, or heater that would be nice too.

I live in NH, so transport on the chests should be via pickup. Let me know what you have and the price

Thanks
Steve AKA Dr Deuce

I ask that not in a sense of scolding or anything of the sort, but in the sense that if it's true, the rest of us in this group need to encourage and facilitate so that you can put this magnificent set up you are assembling fully on the air as well as on the road! Let us know if we can help!

PS, if it hasn't been sent off for scrap (and I hope not!), I know of a PE-95 that may be available for rescue in northeast VT; I used to own it and then mistakenly sold it and it developed some quirks that were beyond the new owner's aptitude or ambition to get to the bottom of. I'd love to rescue & restore it, but my list of projects and existing accumulation of various big iron, relative to time and budget, is already a bit much... If anyone knows of a possible good home (where someone won't just yank the motor to put in a jeep)(this is the original PE-95 (no letter) 5kw with the flathead ford engine) let me know. Joe-- I know that this PS is more for the milgensets group, but could you forward? I am kludged up at the moment on some of my yahoogroups settings...

Subject : RE: [T-368_BC-610] *** SCR 299 parts needed ***

I am putting together an SCR299. I have most of the big parts; K51

truck, K52 trailer, PE95 genset, BC610, the two radios, etc. I need

the following:

JB-69A Junction Box

CO-315 45" cable Jbox to conn

CO-316 100" cable genset to conn

BC-731 Control Box

SW-199A start/stop control box for genset

CH-88 chest on the wall for parts

CH-89 chest you sit on for parts

J45 Key

JB-60 Junction Box telco

CH-112 chest in the trailer

If you had the table, or heater that would be nice too.

I live in NH, so transport on the chests should be via pickup. Let

me know what you have and the price

Thanks

Steve AKA Dr Deuce

It all connects,..... hopefully,..... somehow.

I mean the vehicles, the radios, the gensets,.....
et. al.

# 2641. BC-610 E

Yahoo group: T-368_BC-610
Date: 2006-03-29 17:39:35 UTC
From: W5OMR/Geoff
Topic: 2641  Message: 2641

Good working '610 E model. Used to belong to W5MEU.

I don't -want- to sell it, but financially, have no choice.

Don't worry, I won't be 'giving' it away, either.

What's a fair price?

Working BC-610 E
BC-614 Speech-Amp
complete set of coils (1.5Mc ~ 18Mc)
3 tuning units (40m, 80m, 160m)
D-104 Mic
2 good 100TH's (1 spare)
1 good 250TH (1 spare)
2 good 3B28's
2 good 807's
2 good 2A3's

Geoff,

Ignore those stuck-in-the-60's types with an ancient BA catalog who are going to tell you under $500. Start out at at least $1000 to $1250 and don't take less than about $750 (which would be a bargain for someone). FYI, the other two critical (meaning moderately hard to find) items are the cord between the BC-610 and 614 and the AC power plug (or cord) for the 610. You probably have them there but when you list it for sale should add them to the list of available items.

You're so correct of course, and yes - I have those, as well.

I wouldn't have called it a good working BC-610, unless I had used it,
in it's entirety. '614 included.

Other advice well recieved. Thanks, Robert

Hey, I paid $350 for one last fall that had been lightly-hacked, wasn't terribly ugly, and came with *nothing* but the tubes, tuning units plugged into it and a couple of scruffy coils. So Geoff's has to be worth considerably more than that, in my view. I don't know if you'd get $1K (mainly because someone really has to want it badly), but I certainly agree that a price over $500 is in line, probably in the $700-$900 range. Unless someone lives closeby, the cost of transport gets added to the bottom line.

That said, some of us really love the big iron and will travel to get it. Finding a decent BC-610 of any model isn't as easy today as it was even 5-10 years ago. The better the condition and more complete it is, the higher the price. I'd love to find one of the early models ('D' I think, or earlier)or HT-4 with the two additional side meters, but there just aren't a lot of them around.

Hope it finds a good home!

# 2645. Modfifying BC-610 coils for Top Band?

Yahoo group: T-368_BC-610
Date: 2006-03-30 16:45:32 UTC
From: g3vkm
Topic: 2645  Message: 2645

Hi All,

Just acquired a nice Top Band tuning unit for my BC-610 rebuild project. I know Top Band PA coils are like gold dust so I was wondering if anyone has modified the 2.0 Mc coils to cover 160m? I do have the vacuum capacitor that goes with that coil (several in fact). Main area of interest is around 1850 kc, as that's the high-power section of the band in Europe.

TIA,

Roger, G3VKM - Norfolk, England.

Roger,

Modifying an existing PA Coil for the 160 mtr band is IMPRACTICLE.

Here is a link to a way of building a 160 mtr coil.

http://hamelectronics.com/w1cki/mk160coil/mk160coil.htm

IF you are not into doing this, write me direct. I have two of them that are in EXCELLENT condition. I purchased them at a hamfest locally.

I can and will mail pics if wanted. I got them still in their original NOS box, wrapped in the MIL protective wrapping.

If it is feasible for shipping, and we agree on price, (I'm NOT out to get rich!), we can work it out.

Does anyone happen to have an antenna shorting relay (RY-4) for a BC-610 they would be willing to sell? It's not necessary for operation, but in all three of the 610's I have none have had this relay and I thought it would be nice to have one complete.

Thanks,
Rick/K5IZ

From: Rick Brashear
Topic: 2628  Message: 2651

She lives! The old "H" model came alive this morning in fine form. No smoke, no pops, no explosions! Of course, I still have my fingers crossed until I have it on the air a while longer. I was using a BC-614-C to run the tests and don't have a way to accurately check the modulator bias. So, before I go further I'll see if I can get the old "H" model speech processor going.

If anyone happens to have a BC-614 "F" thru "H" parts rig with a decent front panel I would sure like to work a deal. The one on my "H" model is full of extra holes and the paint job is horrible. It looks like it was painted with a plasterer's brush! I think all of them since the "F" have the same front panel.

Hopefully, I can have it far enough along to get on 3.88* tonight and get you guys to help me set up the audio and see if she has any obnoxious hums.

Thanks a million for all of the parts, advice and encouragement I have received from so many on this list.

Is it 4 pair with over all shield or 4 individually shielded pairs? What gauge is called out? We have Belden and Alpha wire references at work, I can look up the cable type numbers for what is being made now.

Agreed.

I'm sure you will receive email from knuckleheads stating just that.

When I inquired about a E model with a similar goruping of spares.I received
two such emails indicating that the fair price is $500.

The emails also contain other brown squishy stuff in the form of strange
advise, opinions and truly weird ideas ...

# 2659. BC-610(I) - What it SHOULD look like

Yahoo group: T-368_BC-610
Date: 2006-04-07 15:32:46 UTC
From: Rbethman
Topic: 2656  Message: 2659

Tom,

When you work one over, THAT is what it SHOULD look like!

There is NO polishing done. JUST cleaning! Then you get a BC-610 that ANYONE is proud to own and operate!

Wait until I get the pictures up for the T-213. It was a BC-610 reworked by depot in 1959. It was destined to be taken out to sea and dumped overboard. I have it AND all contents, TUs, and PA coils, that came in the depot package. Includes cables and speech amp.

Bob

> Bob,

# 2660. BC-610-H

Yahoo group: T-368_BC-610
Date: 2006-04-07 21:43:30 UTC
From: Rick Brashear
Topic: 2628  Message: 2660

I have a unique problem or it's unique to me. I am using FT-171-B size rocks in my "H" model and they are too tall to let the top door close...? Is this not the correct size holder? They work great in my "E" model. I know the cabinets are different, but I thought the same size fit all. Any ideas?

Rick/K5IZ

# 2662. Long life and Durability

Yahoo group: T-368_BC-610
Date: 2006-04-08 23:52:02 UTC
From: Rbethman
Topic: 2662  Message: 2662

Some may wonder at the "Beastly" BC-610s life and durability.

There is a SW station in South America that has two of them. One runs 24/7 X 365. The second one is a "spare". I don't remember which station it is, but, Jim, WB2FCN, knows of it.

Just like the "Energizer" bunny! Just keeps going.....

From: Rbethman
Topic: 2663  Message: 2663

All interested,

I have an 80kb jpeg schematic that will plug into the (R), right hand
connector, of the BC-614(*), to allow for PTT.

This is NOT an internal modification! Original circuit by KJ5V.
Redrawn ONLY for clarity by WB2FCN. Not MY design!

It can be downloaded by going to:

<http://home.comcast.net/~rbethman/BC-610-PTT.jpg>

I am thinking about using a Johnson Model 122 VFO on my 610-H and need to construct a power supply. I know I need 6 volts for the filament of the 122 and I am guess I'll need 250 - 300 vdc for B+. Can someone confirm this for me? I will be going into the 610 via the crystal socket in a TU.

Thanks,
Rick/K5IZ

I do occasionally, however, they are real touchy, usually have an offensive hum and tend to drift considerably. There are some modifications that can be made, so I understand, that help with the drifting problem and the hum, but I haven't made any of them. I normally use crystals, but it seems with more and more SSB stations bombarding the AM window it's harder to stay dead on 3.880/85/90. I think quite a few 610 operators use external VFO's with great success, so I I'll give it a try with my "H" model. I can leave the "E" model rock bound and tune around easily with the "H".

Military Radio Collectors Group 2006 Meeting

May 5 – 6, Camp San Luis Obispo, California

The eleventh annual meeting of the Military Radio Collectors Group will be held at the NCO Club, Camp San Luis Obispo, California from May 5 to May 6, 2006. Events will formally begin at 0800 Friday morning, but early arrivals are welcome Thursday afternoon, May 4. Registration will be open at 1800 Thursday evening. Those planning to attend are requested to contact Lynn Fielding at lynn@wb6hqk.ampr.org or (310) 533 – 8627.

Those entering the facility must show automobile registration, proof of insurance, and identification at the front gate! See http://www.calguard.ca.gov/cslo/Veh_Pass_rules.htm for more information. Secured areas for equipment
operation and display will be available inside the Club and there is ample room on the surrounding grounds and the campground to accommodate outdoor activities.

Friday will be devoted to equipment setup and display, operating events, technical presentations, and informal gatherings in and around the campground. Special activities may include fox hunts on 6 meters and/or 75 meters. The swap meet will be held from 0730 – 1100 on Saturday morning with a barbecue following at noon ( advance sign up required, see below). Coffee, tea, water and soft drinks will be available during the event. Continental breakfast items and juice will be available on Friday and Saturday mornings Lunch on Friday, dinner on Friday, and a lunch on Saturday will also be available with advance sign up. Contact Lynn Fielding at lynn@wb6hqk.ampr.org for food details.

Tent and car camping will be available on site adjacent to the event. Full RV hookups are available for $16 and electricity and water only are available for $14 per night. Billeting is available at the camp on a space available basi s for $23 per person per night. VIP quarters are $25.75 per night. Hookup and billeting reservations can be made by calling (805) 594 - 6500.

There are no admission charges for this event, but a fair share contribution of $10.00 is requested from each participant to defray event costs.

Points of Contact
Lynn Fielding, KE6JZD (Registration and Logistics)
lynn@...
(310) 533 – 8627

Bart Rowlett, WB6HQK
bart@...
(310) 533 – 8627

http://www.discoverourtown.com/TownPage.php?Town=2156&Cat=Organizations
http://www.calguard.ca.gov/CAAG-MS/
http://www.syzen.com/milradio/

Directions:
From the 101, take highway 1 west, toward Morro Bay.  Camp San Luis Obispo is five miles west of San Luis Obispo. Turn south (left) from Highway 1 to enter at the main gate.  The NCO Club and the campground is on the west side of the camp.  Directional signs will be posted along the route from the main gate to the NCO Club.

Assuming that you are using the tuning units, are you
aware that the input frequency is different for each
unit, depending on transmitter output frequency.
The frequencies listed in the manual, are the frequency
of the xtal, and then the transmit output frequency.
as in on 3880 mhz the drive freq is 3880 to the tuning unit.
On 7290, the input frequency is 3645. I am not sure the
output of the VFO-122 does that, I think it has an output
at the operating frequency only, as in on 7290 the output
of the VFO is 7290, no telling where/if the tuning unit
will be outputting a signal. You might want to check the
VFO-122 manual to be sure.

Rick,
if you are experiencing hum and drifting when in
master oscillator mode with the tuning unit. It might
NOT be the tuning at fault, drifting is usually associated
with the power supplies to the OSC/Multiplier circuits.
If the power changes under load then you will have
drift problems. Monitoring of the VR-150s on the
exciter deck is a good indicator. If they flash on and off
with modulation (AM) mode then definitely it is supply
related. Also a good test is to tune the rig into a dummy
load, set it at around 300 watts, then while sending a few
long dashes in CW mode monitor the drive to the 807s
if that level moves around a lot, power supply is most
likely the problem.

My tuning procedure is to load the rig at the power level
I intend to operate at the approximate frequency, then once
the rig is tuned, I adjust the frequency to where I want it
using a known good frequency counter. After that I have
not noticed any drifting, or hum on the signal.
YMMV
Jim

Once upon a time on a reflector far-far away, someone suggested a cause for drift is
due to interelectrode changes when applying B+ to the oscillator. Apparently the thought
was, it takes several seconds for the elements to 'stabilize'. I experimented with my BC-610
by using a frequency counter and measuring the frequency over time. The greatest shift
indeed occurred immediately following applying B+ and slowly stabilized to a reasonable
amount after 4-5 minutes. The amount of drift is also a function of the oscillator tube
being used. I tried several 6V6s, and noted that some drifted more than others before
stabilizing.

The suggested solution was to keep B+ applied to the oscillator all the time by shifting
the tube's operating parameters from class A on receive to class C on transmit. This is
done by switching the tube's bias as part of the PTT process.

Once this is accomplished, one can go into the tuning unit itself and apply temperature
compensating capacitors to minimize long term drift and, if desired, band spread the VFO
over the range of interest in order to reduce it's tuning sensitivity.

As for myself, other than making initial measurements, I got side-tracked and never
followed up with the bias shift circuit. However it seems like a worthwhile pursuit.

The previous post brought out a thought,
the tube lineup for the exciter section front
end, is finicky, the 6V6 is a 6V6GT, the 6L6
is suggested to be an RCA 6L6 metal, they
don't mention any other manufacturers for the rest
but I have to think someone did some tests to
come up with those two in particular.
YMMV

related. Also a good test is to tune the rig into a dummy
load, set it at around 300 watts, then while sending a few
long dashes in CW mode monitor the drive to the 807s
if that level moves around a lot, power supply is most
likely the problem.

My tuning procedure is to load the rig at the power level
I intend to operate at the approximate frequency, then once
the rig is tuned, I adjust the frequency to where I want it
using a known good frequency counter. After that I have
not noticed any drifting, or hum on the signal.
YMMV
Jim

I do occasionally, however, they are real touchy, usually have an offensive hum and tend to drift considerably. There are some modifications that can be made, so I understand, that help with the drifting problem and the hum, but I haven't made any of them. I normally use crystals, but it seems with more and more SSB stations bombarding the AM window it's harder to stay dead on 3.880/85/90. I think quite a few 610 operators use external VFO's with great success, so I I'll give it a try with my "H" model. I can leave the "E" model rock bound and tune around easily with the "H".

I just checked the exciter tube line up and can confirm I ended up with a V-8, 6V6GT
(Raytheon) oscillator and V-9, an RCA metal 6L6 as being the most stable during my tests.

Good point. The 122 VFO puts out on 160 and 40 meters. It does work
with the '610 just fine in my experience, however. I should add that
usage was principally on 75 meters.....

# 2677. PCBs (polychlorinated biphenols) In BC-610-* HV transformers?

Yahoo group: T-368_BC-610
Date: 2006-04-11 15:23:36 UTC
From: g3vkm
Topic: 2677  Message: 2677

Hi All,

A "health & safety" issue here!

I have three HV transformers (T6) for my BC-610-E, one is a conventional model, made in France, as seen in TM11-826 fitted in the -E model and the other two are smaller, lighter types made by Ferranti which appear to be oil-filled. My '610 had no T6 fitted when I bought it (easier to move!) and I'm intending to fit the conventional version, but I would like to know what the other two are filled with? If it's PCBs then I may have an expensive disposal problem!

The two bear the labels "Ferranti BC54" (the 4 looks to be stamped on later, possibly a build year - 1954?) "TF1A02YY" and "BC STK No 2Z9612.1", the latter being the Signal Corps part number for T6, according to TM11-826.

Any advice welcome! I would prefer The Beast to extrude a "whiff of garlic" rather than that of PCBs! :-))

73,

Roger/G3VKM

All,

The South American that used to use the BC-610 is HCJB in Quito, Ecuador.

Just to fill in the gap left.

# 2679. FS: Terminal Boards

Yahoo group: T-368_BC-610
Date: 2006-04-15 13:10:42 UTC
From: Brian Carling
Topic: 2679  Message: 2679

FOR SALE:

FIVE-way turret type terminal strips - great for homebrewing.
Has two mounting holes and 5 turrets for mounting parts.2.6" long.
Multiple wires may be soldered directly to each turret. These are
top quality, new stock bakelite strips, great for building
classic homebrew tube radio or audio equipment etc.
Selling for $1.25 each or 10 for $1.00 each.

SIX-way bakelite terminal strips.Has center mounting tab
for ground 2.6" long. These rae the traditional tag strips.
Selling for $1.25each or 10 or more $1.00 each.

Pictures and details:

Rick,
Look for a bright orange-reddish hue from the tantalum plate of your 250TH. Your dipped plate resonance should be in the vicinity of 250ma., depending on how you load the transmitter.

Best Regards,
Joe Cro N3IBX

# 2683. BC-610-I Overload relay problem:

Yahoo group: T-368_BC-610
Date: 2006-04-18 22:13:02 UTC
From: yardleyite@aol.com
Topic: 2683  Message: 2683

Hello All,
I've been having a problem with my BC-610-I that I'd like to
ask the advice of the group:

Whenever I key it in the normal high power position, the overload
relay(RLY5?) chatters like crazy and then eventually blows a inline circut breaker, or
just won't key up. If I actuate the plate switch in the HV protect mode, all
is well and the transmitter keys normally, though it reads very little
modulator current. Plate current is approx 100 ma or so in the HV protect mode.

I changed the 3B28 rectifiers as well as gone through the normal checks
associated with this type of problem except pulling the rectifier tubes and key
the plate switch. I figured if the plate transformer was shorted it wouldn't
key up even in the HV protect mode.

Any ideas or guidance as to what my problem could be will be most
appreciated!

Very Best Regards,
Joe Cro N3IBX

Sounds like you lost one of the 100TH modulator
tubes! Bet if you have help, and watch the area in
back by them, you will see the tube/tubes flashing during
the relay chattering episode.

you wont see as much current with the HV protect switch up, as this sets
a resistor in series with the B+ effectivly reducing the B+. As for the
problem, it sounds like a high voltage short in either the modulation
transformer primary, or the plate transformer.

From: yardleyite@aol.com
Topic: 2686  Message: 2686

Many thanks for all who replied. I forgot to mention one small detail:

It doesn't matter if I have it in the phone or CW position, it still arcs over and trips the relay when not in the HV protect mode.

I hope it's not the plate or mod iron, but whatever it is so be it. Just in case I plan on looking at the 100TH's whilst I key the plate. Ditto with the 250TH.

Best Regards,
Joe Cro N3IBX

Hi Joe,

Although not as likely as some of the other suggestions you've received,
it's possible the relay is out of adjustment. The TM has a short
section on how to adjust it for each of the different models. If, for
some reason, the relay is adjusted for the incorrect amount of current
it could be bouncing back and forth causing spikes that could eventually
blow the fuse.

From: Alan Cohen
Topic: 2683  Message: 2688

When I first saw this post I thought about the possibility of the relay being out of adjustment, but dismissed it when it said that the breaker popped. My unit is the F model, which is the first of the "new" case style models. I had a problem with the high voltage wire breaking down. I never did find the exact place where it was happening but the problem went away after replacing the wire. I did not replace the wire on the power supply or modulator chassis, just all the wire that ran between the three decks. It is pretty easy to do, and does not require taking the transmitter apart. You only have to remove the side panels.

I was half way to getting him plans to make an
air-cooled plate transformer for the T-368 but never
finished the project.

Have you ever asked him for such a thing yet?

Joe

Bob,

I've forgotten exactly what all is still on that shelf but it's possible that
I might still have a plate transformer for an BC-610-E. But before we go
down that road, what does that have to do with no B+ in the speech amp?

Hi Bob,

I don't mean to second guess your trouble shooting, but the 610 can
appear to have no B+ under a few different circumstances such as open
safety switches or the key in the speech amp not being closed.

If you don't find something, Bob, let me know. I've got 2 spare '610 plate transformers.

Mind you, I'm in San Antonio, TX - I'm leaving for out of town in the wee hours of the morning, and probably won't be back till NEXT sunday evening...

but I do have 'em.

# 2698. Human-buttons

Yahoo group: T-368_BC-610
Date: 2006-05-03 23:47:27 UTC
From: Icom_R-5@unhcr.umacr.net
Topic: 2698  Message: 2698

This campaign is about Human beings, Democracy, UNHCR, Refugees, The Iraqis, Islam, Kurds, Human rights, Respect, Money, Donations, Angelina Jolie, Pavarotti, Giorgio Armani, Donors, Peace, History, Campaigns and about you if you care about these words.

Hi there,

I am SAM, an Iraqi refugee living in Lebanon at the moment; I have spent the last 10 years of my life as a refugee registered with the UNHCR in Beirut. The last 4 years, I have spent as an activist for peace and human rights (especially refugees and asylum seekers) on the Internet; I'm also books author and ebooks publisher. I have launched many campaigns to improve our situation as refugees in Lebanon and hopefully bring more understanding to our problems worldwide. I helped make many changes and improvements at the UNHCR office in Beirut; I used the Internet as the field for my activities (you can read more about that in my free ebook 'MY CAMPAIGNS'). All my ebooks are free and could be download from my sites.

This is my newest campaign, it's about the illegal and humiliating actions of the UNHCR, who using photos of refugees as banners and human-buttons to collect money. This is an abuse of the dignity and humanity of the refugees and must stop immediately and a clear public apology present by The United Nations High Commissioner for Refugees. My friends, I am talking about the pictures you can see here:
http://lebanon1.bravehost.com/human-buttons.htm

Also you can read my new campaign 'Urgent, we need smile' here:
http://unhcrlebanon.servetown.com/smile.html

For more info about UNHCR and life of refugees you can read my free ebooks. I invite you as fellow humans and members of the world community to support my campaign by reading my article on my site and see the human-buttons. The campaign is to support and improve the UNHCR http://www.unhcr.org especially after the last scandals in the UN and UNHCR, just for example: http://www.mizzima.com/archives/news-in-2005/news-in-april/12-April05-22.htm

"We make demonstration and fast because the UNHCR office in Cairo did nothing for our problem..." http://news.bbc.co.uk/2/hi/africa/4440730.stm

Together we will build better world.

You could reach me fast via this form: http://499angels.net/unhcrlebanon/email_me.htm
and if you like to know more about me, you can google for my name 'osam altaee'.

Thanks

FOR SALE -

Brand new dial drives for 1/4" shaft. Extra nice brass construction.
These appear to be Jackson Brothers units with a 5:1 or 6:1 tuning
ration.
Two hole mounting for front panel is on 1-1/4" centers.
The brass shaft is 1" long and overall dimensions are:
1-1/2" across the mounting ears. Drive body is 1" diameter.
Accomodates any normal 1/4" shaft on tuning device.
I have several of these available.
Will sell for $13.00 each plus shipping.

PICTURE AND DETAILS AT:
http://www.af4k.com/miscpart.htm

# 2708. 20m AM Activity

Yahoo group: T-368_BC-610
Date: 2006-05-24 11:24:19 UTC
From: Brian Carling
Topic: 2708  Message: 2708

Don't forget to try 14286 kHz every once in a while, guys!!

Here's a good report about QSOs into ZL on 20m AM lately!

= = =

I talked to Bill, W8VYZ on 7290 kHz for over an hour while
I was mobiling out to Dayton.
He is getting on 20M regularly, but most recently he has
been signing on at about 2230 EDT. Apparently the band has been
very good lately and an AM station from New Zealand running 200 watts
has been a regular on frequency and near that time..

Nice to hear about your activity. I'll try to fire up on 20M more
frequently.

Dale

I may have mentioned this before, but might you consider a few choice frequencies for rigs that require 2nd harmonic usage (like TCS and 102E radio sets), e.g.: 1942.5 for 3885? Just a suggestion... I could use several.

# 2711. G4GEN's SCR-399 Photos

Yahoo group: T-368_BC-610
Date: 2006-05-27 19:13:19 UTC
From: g3vkm
Topic: 2711  Message: 2711

Hi All,

I visited Alan, G4GEN, today and had a look at his new acquisition, a virtually 100% complete SCR-399 in its shelter, mounted on a 2-1/2 ton truck and complete with the generator and trailer. Alan allowed me to take some photos and asked me to put them up on the web site, pending his getting some professional shots taken in the near future.

At the moment, Alan has the truck in store pending some restoration work and it was not best sited or lit for photography, but I did manage to get a few shots of the interior. Due to the 5mB limit on photo uploads I've only managed to get three pictures onto the Photos page but I think they give some idea of the condition of the equipment. The excellent condition of the radio gear can be seen in the close-up of the BC-312 RX; there is a complete set of cables for all equipment, all the original spares and their cabinets, etc. etc. Alan is missing only a tool box and the Signal Corps typewriter. The interior is superb and it was a great thrill to sit on the operator's seat and give the J-37s a good pounding! The cab is also very good, with the speaking tube installed and only 10000 miles on the clock!

Anyway, I won't steal Alan's thunder; he will no doubt want to let the group know the progress and history of the system when he has the time. The truck is believed to have been involved in the Battle Of the Bulge and was then handed over to the Luxembourg armed forces at the war's end. A set of logs found in the shelter refer to an exercise in 1966, possibly the last time that the equipment was used.

Hope this is of interest!

73,

Roger Basford, G3VKM

All,

Great pictures!

Just curious, does anyone know of a comparable 299 and/or 399 on this side of the pond? Back in the early 90's when I was living in MD there was a sighting of a complete 399 supposedly imported by a vehicle collector from "somewhere in Europe." Disappeared before anyone could get a look at it reportedly sold to a "collector on the West Coast..."

Anyone know more?

From: Steve & Jeanne Keith
Topic: 2713  Message: 2713

If the chap with the SCR399 has it on a CCKW deuce, tell him about
www.cckw.org and have him post the pix there too.

If anyone knows of an HO-17 shelter anywhere around the New England
area for sale, please let me know. I would love to build an SCR399 for
my cargo deuce.

I am presently restoring a Chevrolet K51 Panel to its original SCR 299
configuration. I have the receivers and a BC610-E along with the
PE-95 genset and the K52 trailer it mounts in. The motor is in and I am
rebuilding the front end right now. It will drive in and out of the barn
shortly using the front wheel drive so that it can be fully sandblasted
outside. If anyone would like to see pix of it as it is right now, send
email
to cckw@.... Dale Gagnon (don't remember his call) is working
on the BC610. Unit is expected to be operation next year.

# 2714. Rochester Hamfest! THIS WEEKEND!

Yahoo group: T-368_BC-610
Date: 2006-05-30 02:06:16 UTC
From: redmenaced
Topic: 2714  Message: 2714

I will be there with several big sheets of Glasstic, good for window replacements where you might want to run antenna wires through the basement window or whatever.

I also have several Hexacon 60 watt soldering irons NEW in the original box, hatchet style. Hopefully the tips will be in by then but not sure about that one.

These are part of the remains of Acme Electric in Cuba, NY.

Hmm,... what else should I bring?

Joe

# 2715. FS: NEW CRYSTAL FILTERS 1650 kHz

Yahoo group: T-368_BC-610
Date: 2006-06-01 13:41:29 UTC
From: Brian Carling
Topic: 2715  Message: 2715

FOR SALE:

NEW SSB Crystal Filters. 1650 kHz center
frequency.
I have no technical data on these.
They are brand new and in great shape. Simple
connection with IN, OUT and
SHIELD. Labelled as NETCOM Center Frequency 1650
kHz MDL. 1435.
Will sell for $5.00 each or 5 for $20.00 plus
shipping.

Picture and details at:
http://www.af4k.com/miscpart.htm

# 2716. FS: VERNIER REDUCTION DRIVES

Yahoo group: T-368_BC-610
Date: 2006-06-01 13:53:25 UTC
From: Brian Carling
Topic: 2716  Message: 2716

FOR SALE:

REDUCTION DRIVES by JACKSON BROTHERS.
Brand new dial drives for 1/4" shaft. Extra nice brass construction.
These appear to be Jackson Brothers units with a 5:1 or 6:1 tuning ratio.
These are the same as used in the Heathkit HW-101, some Swan models and
other rigs.
Two hole mounting for front panel is on 1-1/4" centers.
The brass shaft is 1" long and overall dimensions are:
1-1/2" across the mounting ears. Drive body is 1" diameter.
Accomodates any normal 1/4" shaft on tuning device.
Several are available for $13.00 each plus shipping.

Picture and details at:
http://www.af4k.com/miscpart.htm

# 2717. FS: A Batch of 9 cool old CR1A Ham Crystals

Yahoo group: T-368_BC-610
Date: 2006-06-09 23:44:03 UTC
From: Brian Carling
Topic: 2717  Message: 2717

FOR SALE: NINE ham band CR1A etc. crystals

Time to dust off those WW2 rigs and put them on the air.
Or homebrew something. I may even have a socket for these.

These are CR1A crystals with 1/2" [pin spacing, and pin diameter
is slightly larger than an FT243. I may even have a socket
or an adapter for these.

Frequencies:
7017.6, 7038.9, 7270.0, 7270.0, 7280.0, 10125.0 kHz
10141.7, 10208.3 kHz, 24.833 MHz

So, a kind of random mix of 40m and 30m and 12 meter
rocks. Fun for homebrewing.

One has the pins slightly squeezed in but it still works fine...
All are CR1A rocks (8) except for the 7038.9 crystal which
is in a DC35 holder from :Silver Cut Crystal Co." and has
one slightly munged pin. Kind of a mongrel group, so
the price is low, he he...

The first $18.00 plus $6.00 shipping takes them home.
E-mail me if you would like them. 73 - Brian, AF4K

# 2718. FS: Lacing Cord etc.

Roger,

It was built for the SCR-193 (BC-191). I don't think I would subject it to a BC-610.

Hi guys, Well the time has come. Looks like we are moving
and not going to be able to do the heavy iron. Most all of you have
heard my T-368 that I purchased from Jeff W0XV about a year ago. It
has full output and has the N9FOY Speech Amp. Sounds great on the air
and works great. Need what I have in it and that is $2500.00
There are some pixs and audio clips on my web site at www.w1pe.com
It off course is a pick up in Mesquite.

I am not leaving Dallas just going to a different qth... Will still be
on AM but with my rice box and amp...

Call me or e mail me...E mail at rwpeters@...t Call me at 972-
288-9911.

I have a nice NC-303 w/original National speaker, National 2m converter
and original manual all for sale, asking $595.00 for all of it FOB 78013.
The radio is very clean and seems to work ok, but I just purchased it
from an estate and do not have much time in checking it out. From the
top it looks all original including power cord. There is very little if
any hum in the audio.
Pictures in my gallery under the HF receivers ;

From: Rbethman
Topic: 2727  Message: 2729

Bob,

If you CAN get access to the internals of the meter, "SLIGHTLY", very much so, with a jeweler's screwdriver, loosen the screw that is the bearing on the front of the shaft.

Do this with CAUTION! Better meters use ruby bearings because they are also "self" lubricating. They ARE very delicate.

Try about an eighth of a turn at a time to get it to float loose as is normal. These "older" meters have most likely developed "crud" on their shafts where they are supported by the bearing.

Replace them if this procedure DOESN'T work.

# 2730. Free Items and FS: PLATE TRANSFORMER

Yahoo group: T-368_BC-610
Date: 2006-07-03 16:27:36 UTC
From: Brian Carling
Topic: 2730  Message: 2730

I have several give-away items and a large
plate transformer for sale.

FREE:
Realistic speaker switching box - let's you connect
your stereo, computer or other sound systems to
multiple speakers. Will connect the left and right
channel of stereo amplifier to THREE different sets of
stereo speakers. Free for shipping.

FREE:
Language Lab Communications console.
5 way intercom with switching and speaker built into a
high quality sloping front cabinet. Free for shipping.

FREE:
300 OHM Clip-on Connectors. These are the ones
you use to connect 300 ohm twinlead to antenna
terminals, or to quickly conect any cable to
a dual screw-terminal type connection.
QTY 5 available free for shipping.

PLATE TRANSFORMER:
QRO Plate transformer with 120V AC primary.
Secondary is 2500V CT at 500 mA. Terminals are on a
ceramic plate on top. Dimensions: 8" X 7 " X 10" tall
Quantity 1 only. I need the space, so it is
available for $20.00 plus shipping.

I am assuming you mean the panel lamps.

If the bulbs in question are similar to the ones use in the BC610 then
Home Depot sells them at something like $5 for 2.

And of course you can't find them on their web page.

Hello Group!

I would like to offer for sale a very good Antenna tuner which I believe matches or was used with the T-368. The tuner is a BC 939 B. It looks as if it would match just about any kind of antenna and it it appears to be able to handle lots of power.

It is in very good condition but would benefit from a new spray coat of military grey paint.

$ 150.00 and buyer pays actual shipping cost. I am located in Seattle.

Topic: 2746  Message: 2749

Bob,

The BC-939B was relabeled TN-339 and issued with the T-368.

Jay, (the seller below) FYI , it's not built to match just any antenna. It was designed and used to match either a long wire or the standard military 15 ft whip antenna which was mounted on the communications shelter, thus the T-368 could be used while the truck is in motion. It won't work with a dipole.

Won't generally match a "long wire" either, i.e., an antenna multiple wavelengths long, as the term is understood by hams and as defined and described in various antenna handbooks. The Military apparently meant "long" as opposed to a 15 ft whip and provided only 100 ft of wire for this purpose with the SCR-399/499 (TM 11-281, March 1945).

The BC-939B specifically uses EITHER a 44 ft OR a 77 ft "long" wire
according to the tables provided in the manual.

Also MAY require the fixed Vac Caps for it, depending on freq. covered
and configuration.

From: Norman & Barbara Ray
Topic: 2754  Message: 2754

One of the greatest thrills in life is the owning and restoration of a BC-610E. The time has come to let someone else enjoy the thrill of owning one. I have restored and am have been operating a BC-610E and would like to move it to someone who can give it the attention it deserves and could pick it up in the Seattle area. We can discuss a price with interested parties. It includes the basic transmitter which is in its original configuration except I converted the power supply to Unitrode solid state rectifiers but have the tube socket assemblies to return it to its original state if desired. I am a believer in maintaining these jewels as they were intended. It includes:
BC-614E Speech Amplifier, BC-739A Antenna tuner, AT-2 Antenna Coupler (earlier unit which has some modifications, Home made antenna tuner to accommodate doublet antennas and harmonic reduction, Several manuals, large number of NOS as well as tested good replacement tubes. Vacuum Capacitors, 12 coils, 16 tuning units, LN-13 VFO unit with power supply and a Heathkit VF-1 VFO.

Obviously I am not interested in shipping this "National Treasure" .

From: Mark Foltarz
Topic: 2755  Message: 2755

Fellas, too much of a good thing is sometimes too much.

I am moving to Florida and I am trimming back on duplicates.

The GPT 750 came from a good home in Toronto.

This one needs the VFO to be out in to be original. I will supply a TMC VOX ( the VFO ) that you can put in the RF deck. There is no modulator.

I will supply an additional power transformer also. The manual is supplied via PDF.

This can be moved by one person in a mini van. I did it.

I have another 750 ready to go on the air. I just don't need a second one.

Asking $500

The GPT 1K consists of everything except the wattmeter unit and the power supply unit for the exciter. Power transmformer for amplifier missing. I will supply a suitable equivalent from a BC610F.
The orignal rack is included.
Also can be moved in a minivan.

Asking $875

picture will be posted to AMfone soon.

Hello Bill Harrill & Crew,
The ONLY WILCOX Transmitter that I had ever seen was at KEESLER AFB, BOLOXI, Mississippi in early 1962 while attend HF SETS. This was the WILCOX 99C which was considered to be a light radio Transmitter, thus was assigned to Air Force Ground Radio 304X2 Repairman for maintenance and support. I only made an adjustment to the Bias or HV, and had no other experience, plus never encountered it in the field during my 22+ years in the Air Force.
73,
Glen Galati, KA7BOJ
Tacoma, WA
eldim@...

---------- Original message from "Bill Harris" <w7kxb@...>: ----------

Would like to touch base with anyone who is knowledgeable of the
transmitter line manufactured by Wilcox-Gay, of St.Louis, MO; back in
the 40's till the 60's??? Their equipment was used by the military in
fixed HF transmitter sites.

Cheers

BillHarris

# 2758. WTB: BC-610-E Relay Cover

Yahoo group: T-368_BC-610
Date: 2006-11-18 12:12:48 UTC
From: g3vkm
Topic: 2758  Message: 2758

Hi All,

I'm looking for the relay cover that fits over RY2 & RY5 on the HV chassis of my '610-E. Anyone have one in their junkbox?

73,

Roger - G3VKM, Norfolk, England.

# 2760. 5933 clamp tube

Yahoo group: T-368_BC-610
Date: 2006-11-21 23:44:19 UTC
From: n8lka
Topic: 2760  Message: 2760

I went to a hamfest a few days ago and purchased some tubes for my dx100. I bought a nos 5933/807w,I put it in the t3 and left it on for about 20 min. When I keyed it up it only ran about 75 watts of power. The 4-400a tube went bad. Could this be because of a bad 5933 tube? 73 Gary ps The t3 ran full legal limit before I put the 5933 in.

# 2761. vacuum cap for BC 610

# 2763. BC-939 Tuner

Yahoo group: T-368_BC-610
Date: 2006-11-24 15:20:29 UTC
From: W5OMR/Geoff
Topic: 2763  Message: 2763

Hey, gang. Hope everyone had a good Thanksgiving.

Personally, I'm thankful for the veterans who lay their lives on the
line to insure our freedom.

That being said, a friend of mine, W1JD in Maryland, is looking for the
schematic diagram for the BC-939 tuner that goes with the BC-610.

His message to me stated:

~~~~~~~~~~~~
> You have a BC610, do you have the tuner that goes with it, the BC939?
> If you do, to you have the manual that goes with it?

<...I replied...>

There is a yahoo group that you can look at
http://groups.yahoo.com/group/T-368_BC-610/

If you join, they could probably tell you something about it.
~~~~~~~~~~~~

I don't know if he's joined, so I'll ask. Anyone have a manual?

Actually that's the 1.0-2.0 MC kit. The fixed vacuum capacitor (C-28) supplied with the SCR-399/499 and AN/GRC-26 is 50 uuF/20 KV except later production was 55 uuF. The two fixed vacuum capacitors supplied with the BC-939-(*) and TN-339/GR are 12 uuF or 15 UUF and 50 uuF or 55 uuF. But you have to be careful not to mix these with the one(s) for the transmitter. The ones used in the tuner are only rated 12 KV but are (depending upon who made them) visually identical to the 20 KV units.

Hello Tom & Crew,
What is the TM for the GRC-36D? Could this be a TYPO,
and should read GRC-26D?
That number for the Control Interface seems familiar, but I can't visualize it at the moment.
I don't have a manual immediately available. Do you have a picture that you could post?

Yep, it's a typo. Clumsy fingers and all that. GRC-26D it should be.
I thought I had a manual nearby, but I can't lay my hands on it.

Hello Tom & Crew,
What is the TM for the GRC-36D? Could this be a TYPO,
and should read GRC-26D?
That number for the Control Interface seems familiar, but I can't visualize it at the
moment.
I don't have a manual immediately available. Do you have a picture that you could post?

73,

-------------- Original message from Tom Norris <r390a@...>: --------------

Does anyone have an "extra" C-1123 control box just lying around that
they'd be willing to sell very cheaply to a poor poor pitiful
impoverished ham? (ok, not so pitiful...) This is the box that goes
between the T-368 and the R-390 (or 390A) to make a more "proper"
hookup between the two. It's not an essential thing, but the thought
popped into my head while looking though the GRC-36D manual so
thought I'd ask around.

Tnx and 73

Mr. Bethman,

Hi.

I'm the list owner/moderator.

There was ONE person wanting to be signed onto the list yesterday, he was, in fact, signed onto the list yesterday. He was the ONLY one wanting to be signed up in several weeks, but you wouldn't know that would you?

Do let me know if you have any other concerns regarding running this list in the future, I will be more than happy to address them in a timely manner.

Thank you,

Joe KG2CI

From: bearlabsusa
Topic: 2784  Message: 2784

Hi,

Thought I'd introduce myself... I'm "bear" WB2GCR, near Catskill and Albany NY... Just stumbled into a T-368. I'll skip the story, and direct you to http://www.amfone.net under Technical and the thread is "Canadian Marconi?" (some pix are there too) - since the guy who was selling it found that name on some sort of stubby antenna thing that came with the T-368 and thought that was what it was, whereas the plate on the RF deck is MIA/AWOL.

Well, it is/was mostly there. Missing the Plate Loading cap! Oddly stuck in its place is a (gack!) 70 Amp fuse!! Dunno.

I plan on taking the B+ off the Pi-L network. So, after only a week of casting about looking for a suitable vacuum variable cap I found a nice 5kv 1500pf one, that should fit with ample room and not cost too much! Which is good.

So, do you think the 5kv/100Amp rating of this cap will do the trick, given the fact that the DC is off the tuning network??

And, what was the ORIGINAL cap's rating??

Anyone have the Mil parts list document??

The plate on the exciter says: "BAND SLLECTOR"

I managed to get the icky grey paint off that, with Lacquer thinner, revealing nice lighter grey paint under... any idea what the nicer paint is, or what to use to get close to that??

The repaint job had bad masking... razor marks in the finish around the engraved labels... geez...

Oh, the Filament meter has some sort of varnish like substance inside the plastic face - I've removed the face, but it is unsalvagable. The movement is ok. Looks like it is from some glue or rubber compound inside the meter case!! I can fab a new one, but that's a fair amount of work for a stupid meter face, given that they are not just flat glass (actually this one is plastic). These are the sealed meters, with metal bezels. Any ideas?

The PS chassis appears to be an early version, since (thankfully) it has the dual primaries.

It looks like it was "redone" at least once, since it has the big white mica cap in the RF section, mounted on phenolic, like the manual shows for the later versions.

Also it has a paper tag hanging on the RF deck that shows service in 1980 (!!) by RADALAB, Inc...

Any thoughts on a possible way to figure out the mfr and/or date? Was the front panel plate the only place it was labeled??

This unit looks like a ham owned it before it passed to me, since it had masking tape labels that said "DIP" and "PEAK" over the plate and loading dials... probably and old-timer, since the second set was much BIGGER than the first set that I found underneath...

Glenn, et al,

A substitute would probably work.

I do not have ANY current ratings for the voltages.

Manual simply says 75W.

Primary 110-125VAC
Sec:
330VAC to 5Y3GT
Center tapped to GND
5VAC for 5Y3GT
6VAC for 5 - 6 Volt filament tubes - 6H6, 6SG7(2), 6SA7, 6SC7,
6K6GT, & 6SK7
* Assuming 200, 240, and other voltages done by voltage divider in
circuit.

Check the condition of your Fil Pot, maybe it has a
problem physically or electrically. Either the wiper
may have gotten too wide or a winding has shorted one
to the next. These have a lot of heat on them when
running, mine came with a big burn-out on it.

I found the problem with my T-3. Last summer I removed the blower power from the T-3 to run the blowers on a variac to have less blower noise. So -20 below temp this morning it was time to check out the Filament voltage. Changed to blowers back to the T-3 power and now my Filament voltage is working like it should. Must be a loading with the blowers in line. I sure would like to have less blower noise in the shack HI HI. Any ideas on how to get around this blower noise?
Thanks Teran KF0HR in North Dakota

Teran,

First, don't slow down the blower on the PA chassis. Air flow around the 4-400 is very important.

On the big cabinet squirrel-cage blower's noise level, you can merely disconnect this unless you're running for really extend periods of time or are operating in a very warm environment. The latter shouldn't be a problem in North Dakota!

Or, just remove the back cabinet panel entirely and run the rig that way. Covering the back with a piece of heavy screen or metal mesh would be a good idea. You'll have to wire around the back cabinet interlock assembly if you do this.

Well,
The rhheostat used for that has a replace-able wiper contact,
could be worn down, it is a "brush element" easily replaced.
if the rheostat itself is busted, Ohm-meter check across the outside
terminals will tell that. Check the wire lead that goes to the wiper
also sometimes they break. If you find that the rheostat is bad, send
me and email I will try to pull one out of storage for you. Also available
online but very expensive.

Hmm,...

I'm having a hard time believing that the blowers are loading the line down enough to show on the filament circuit.

Have you checked all the neutral connections in the line that feeds your transmitter circuit, from your service panel all the way to the outlet? Is this transmitter the only thing on that circuit? It really should be a 30 amp circuit dedocated only to the transmitter, otherwise you risk having a voltage drop when you transmit.

Also, how far is it to the transformer on the pole in that feeds your house?

One way to reduce blower noise is to enlarge the hole in the back panel to 4+" and add a "turning vane" inside the 90 degree fitting between the panel and the blower inlet. You'd be amazed how effective that is.

Or you could just put a muffin fan in the hole in the back panel.

JOe

North Dakota? Just how far "out" are you? Do you have a good solid 120+ volts in your house?

# 2794. Stripping Panels & Paint Choice?

Yahoo group: T-368_BC-610
Date: 2006-12-04 04:26:08 UTC
From: bearlabsusa
Topic: 2794  Message: 2794

Wonder what the opinions might be on stripping the paint from the main panels?
What to use? Or not?

Then what about repainting?

Paint choices?
Colors? (yeah, grey but there is gray and then there is grey...)

My unit seems to have been repainted in a darkish, dull gray over a lighter, nicer gray.
I'd like to duplicate or come close to the nicer grey. Looks sort of akin to what Henry used, and what TMC used... modest gloss, nice color.
Any sources, ideas?

Teran,

Were you previously running both the cabinet AND THE PA BLOWERS off a variac?
If so, this could explain the high filament voltage you were seeing. The
PA blower is fed off the circuit controlled by the FILAMENT rheostat R18.
Removing the fan motor from this circuit would reduce the current through the
rheostat thus raising the filament voltage. Reconnecting it would return the
filament voltage to it's original design range.

If I may make a comment, when I first commissioned my T-368A, I noticed that the filament rheostat really heated up the area around it and that B+ was several hundreds of volts high. After probing I discovered that if I ran the T-3 on 115 volts (via a 20 amp Variac), and no more, all the voltages and metered values came into book "spec". The fil pot is now set to about 75% of the full travel. The heat generated by this pot is minimal and the tx power out is running about 400 watts.. I believe that T-3's like to be run on 115 volts, and no more..... de K3HVG

# 2797. T-368 Filament Voltage

Yahoo group: T-368_BC-610
Date: 2006-12-04 13:18:13 UTC
From: kf0hr
Topic: 2787  Message: 2797

Hi to all the T-3 help,

Dennis,

You are correct on the blowers. I unhooked both from the T-3 and powered them both on a variac. Worked great....could hear the receiver. Then I looked at the Filament voltage and it was 6.2 and R-18 didn't change it? So put the blowers back on the T-3 and all works as it should. Running the blowers at 70% sure made a big change on noise. If the tubes will last 10 years with full blower and 7 years with reduced. I can live with that. I just need to load the blower line with a large resistor and that will make more heat. Anyway all is back to normal including the fan noise.Buy the way I do run the T-3 at 115 volts with a variac.

Thanks,
Teran KFØHR in North Dakota

From: Gene Beckwith
Topic: 2787  Message: 2798

*Gents,

Reading all comments to the reflector with interest and filing many for future ref...

My T-3s are operated from dedicated 120 vac line breakered at the box at 30 amps...with intermediate fuse block at 20 amps with dedicated disconnect....then, on to a whopping big GE variac salvaged from a friend's garage and set at 115 volts....with AC line voltage monitor....

I see some line voltage variation....regulation is poor from the poll, ranging frm abt 117 volts to 122 volts on some weekends ...

Panel temperature around the fill pot is moderately warm over a days idling/operation....

It has been discussed many time that rigs of this vintage were designed for a nominal 115 vac - - the subject has been treated extensively on the old R390X reflector, with several techniques advised for reducing voltage at the power supply so the rig would operate closer to 115 vac. much was data presented confirming extended tube life and cooler running at design operating voltages..

Bottom line: seems like a good idea, if you can come up with the controls, to get the T-3 close to 115 vac...

73, and sorry not to have more time for comments....

Gene

From: w7qho@aol.com
Topic: 2787  Message: 2799

Teran,

From your comments not sure you understand there are TWO separate blower circuits in the T-368. The blower on the PA chassis is connected to the "filament" circuit which, in turn, is controlled by R-18, the FILAMENT control on the front panel of the modulator deck. Not a good idea to reduce the speed of this blower which isn't that loud in any case. The other blower, the large, noisy unit mounted on the back panel is connected across the incoming primary power line. As I mentioned in a previous e-mail, this blower can be disconnected completely in normal ham use without serious consequences. Or for extended use, hot environment, etc. you can run with the back off which is what I do.

In the matter of T-368 line voltage, the rig was designed to operate in field environments where the primary power voltages could vary significantly which is the reason for the inclusion of the FILAMENT rheostat. I've run my pair of T-3's on 120-122 volt line voltages for years with no problems. Yes, R-18 does heat up the front panel but the rig was designed to run 24/7 that way. I've also operated these rigs in portable situations where the input voltage varied 120 to 110 vac key up/down with no problems. I guess holding the line voltage to exactly 115 vac is OK, but not worth the investment in a large variac, tapped line xformer or whatever to do so.

Considering that most of us are loyal Americans, it's hardly off topic
or rude. Maybe you need to look at your own post and protocol,
comrade. You could always unsubscribe if you don't like it. Oh, wait -
your socialist views don't allow for any accountability or
responsibility on your part. I forgot (briefly).

I'm not quite sure how this got on this list or just where it came
from but I don't see any need to clutter up everyone's E-mail box with it.

I don't know about everyone else but I only have a dial-up connection,
it is very slow and not very dependable.

Ok, so I'm grumpy, I spent all day at the Tracewell Systems auction in
Cuba, NY and didn't buy ANYTHING! It all went too high for my budget.
'nother electronics/defense contractor down the tubes.

Joe (list owner(grump))

From: k5lar
Topic: 1258  Message: 2804

Looking for a worthy home: I have posted my T-368 C transmitter and 939 B antenna tuner on QTH. It has not been used by me, and has not been used in over 5 years now as I understand it.
<>
Too many interests and activities personally, and would like someone to put this unit on the air with the big dogs!
<>
Sale will include extra tubes, microphone, some new stainless hardware, and manuals. Would prefer pickup in central Texas, but will entertain delivery in my POV for a reasonable fee, if practical for me. Thanks!
<>
Price is $2,400. Cell # is 254-421-2906.

# 2805. RE: [T-368_BC-610] T-368 For Sale

With no sarcasm or judgment intended toward anyone, is this indeed the current going rate for a
complete T-3?

If so, they have certainly appreciated nicely since Fair Radio used to sell them for about 695 in
the late 80s/early 90s ! (yeah, I know, supply and demand...).

Trevor,

I initially thought the same, but I believe this is indeed the going rate as I know of two more available in the $2k range. Likely, there are also still bargains to be had as well. I too am glad I was able to buy my scrap in 1990.

From: r390b
Topic: 2811  Message: 2811

Been looking for an MD-239 for some while, but other than what folks have with there stations they no longer seem to exist, one fellow even said it was worth more in parts as audiophile components than hams would pay for it!! (not making it up - not sure what those parts are, though...)

It's not something I really *need* and I'd be satisfied with a gutted case and build my own "modern" fsk exciter that looks like one if need be.

I've pretty much given up on a tuner, as a couple folks changed their minds at the last minute, wanting them instead for amp parts.

Any help, suggestions, where to shove it, etc?? LOL

Thanks for your patience

Hi all...

I am looking for the center front panel (the one with the meters in it) for the BC-610 "E" model. I don't need the meters or anything else, just the metal. It needs to be in good shape with clear lettering and no extra holes. I will pay a fair price for the right piece. It can have the meters and stuff, but is not necessary.

Thanks,
Rick/K5IZ

# 2813. Transformer baking Recovery

Yahoo group: T-368_BC-610
Date: 2006-12-18 22:56:48 UTC
From: Rbethman
Topic: 2813  Message: 2813

Folks,

Most of us have power, mod, audio, and "other" transformers that have been "due to storage requirements", exposed to humidity.

The 90 Deg C temp converts to 194 Deg F.

This would seem to be a starting point for a multiple hour bake session.

My Electric stove/oven has a 200 Deg F setting.

I plan to make some baking runs on xfmrs for periods between 2 to 4 hours.

This SHOULD take care of "simple" humidity issues.

Dealing with REAL MOISTURE issues is someplace I've been. The year was 1975. My team and I were installing a replacement 1500KW, 4160VAC, 230A 60 Hz synchronous generator.

We were located on the Island of American Samoa. The military transport folks, for reason never determined, had left this in an unprotected wood shipping crate. This crate sat OUTSIDE for about weeks in the summer tropical environment AND rains.

We acquired about 12 floodlights, sockets, wiring, and plugs. We removed the end bells and confirmed a "Depot Rebuilt" assembly that was indeed SOAKED.

We baked it with the end bells OFF for two weeks in a water-proof shelter. Testing was performed with first a Megger, then followed by a "Hi-Pot". We determined that our effort was successful.

Several days later, we installed it, aligned it with the prime mover, and then, crossing our fingers, started the generator, flashed its field, and achieved full output voltage. We did a careful step loading until we reached full power of 1500KW 4160 3 Phase VAC at a power factor of 0.8.

It was run for 72 hours in that condition. It performed flawlessly.

To MY knowledge, this piece of equipment operated for at LEAST four years without failure.

Baking works! WE just shouldn't have to go to THOSE extremes to safely recover OUR transformers. Unless we have managed to let them get WET.

*Gents,

I regularly re-hab heavy metal rigs here at W8KXR....It is sop to use a 500 watt heat lamp at about six to ten inches for two to three hours on any and all xfromers before firing up any of my heavy metal rebuilds....

The lamp is mounted in an old photo lamp reflector and is either clamped in position, or played on the iron with the lamp assembly held by a tripod that was part of the photo lamp package....depending on accessability...

Depending on the size and mass of the iron...I use ''engineering'' judgment as to whether the iron is heated through....depending on judgment and history of the iron....several sessions may be used, to ensure heating through.

Heating not only helps to drive out residual moisture from long exposed/stored xformers and chokes...but also, in the case of some xformers and chokes, helps to soften and re-seat resinous packaging material...

No real certainty that heating will rescue/save all heavy iron...but it's cheap and easy and standard technique in my lab...

73,

Gene

W8KXR

# 2817. BC 614 nd BC-610E

Yahoo group: T-368_BC-610
Date: 2006-12-19 20:04:12 UTC
From: John King
Topic: 2817  Message: 2817

I have the following in original condition with
interconnecting cables:

BC-610 E Transmitter
BC-614 Speech Amplifier
JB-70A Junction and control box
BC-342 receiver

These came to me unconnected, of course, but as a
"station"

I know a ham who did not use his BC-614 speech
amplifier with his BC-610 because he found it "bassy"
and wanted a broader and higher frequency response. He
homebrewed a speech amplifier to use with his BC-610.
Based on YOUR EXPERIENCE and KNOWLEGE, is that a
common problem bor the BC-610 when used with the
BC-614A?? Was his fincings common? Does the
BC=610E/BC-614A usually sound "bassy"???

What do you think of the usefulness of using the
JB-70A Junction Box? Is the Junction Box a valuable
accessory?

I have a Hallicrafters SX 28A that I plan to use as
station receiver with the BC-610E station instead of
the BC-342. Seems that the SX 28A would be more
appropriate, but I will need to go through the SX 28A
and re-cap it before using it.

Your input, advice, observations and tips will be
appreciated. 73, John, K5PGW

The tag on the front of my BC-610E says it was manufactured by Hallicrafters and is serial # 1769. Is there any way to tell the year of manufacture? It has a decal on the front that says 9th Naval District. Do you know where the 9th Naval District was? I suspect that it came from a Naval Reserve Station, but that is just a guess.

My BC-614E is serial #3606. I am trying to get familiar with it. It has no back cover. Was there ever a back cover to the transmitter cabinet? 73, John, K5PGW

9th Naval District covered a pretty large territory, including the
following states:

Ohio, Michigan, Kentucky, Indiana, Illinois, Wisconsin, Minnesota, Iowa,
Missouri, North Dakota, South Dakota, Nebraska, Kansas.

HQ was at Great Lakes Naval Station near Chicago.

John,

When they were manufactured they ALL had a back panel.

The reasoning is unknown, but I suspect that owners/operators OTHER than the military made up their mind that the BC-610 needed to breathe more. They DON'T! They will run 24/7 without cooling other than plain old convection.

The JB-70 junction box that you have will make it easy to set up for PTT operation.

The BC-614 is more than adequate for speech amplification. There are some that have and do feed the BC-610s with audio from another source.

Welcome to the REAL Boat Anchor Club!

John,

There are four interlock switches that disable the plate relay. Although I can't for the life of me recall where the 4th one is. But if the transmitter was being operated with the back cover missing, the previous owner must have disabled or bypassed that one. And if he did that, you'd better play it safe and check the others before you go and apply AC and stick your hands inside. The 2nd and 3rd ones are operated by the two doors in the top cover. Someone else will no doubt recall where the 4th is physically.

In the late 50's there must have been a lot of BC-610's turned over to Naval Reserve Centers or Training Facilities. My first BC-610-F came out of the one in Ruston, LA.

# 2823. [T-368_BC-610] BC 614 Question

Yahoo group: T-368_BC-610
Date: 2006-12-20 15:59:43 UTC
From: james1787@aol.com
Topic: 2817  Message: 2823

I am still a relatively new BC-610 owner. My BC-610E has been sitting in the basement for several months now, I have finally printed out (as of yesterday) the manuals for it so I can start dissasembly, cleaning and restoration of the transmitter.

I have a few questions -

Is the BC-614 necessary to it's operation? I don't know much about this unit other than it is a speech amplifier. Is this where you would plug in a mic or key? I don't see anywhere on the transmitter where a mic or key would plug into.

As far as cleaning the insides go, I plan on using some simple green and a soft brush and carefully washing each section and allowing to dry thoroghly (heh, it'll probably get a few months to dry). Is this a good method or is there a better way to clean it? Any reccomendations for safely cleaning the oxidized contacts of the plug-in coils, TU-52, etc?

Were there crystals for it in the ham bands or is it up to us to modify crystals for it?

Sorry for all the questions!

73,

James KB2FCV

Topic: 2817  Message: 2824

Hi James,

Those are all very good questions. I'll try to tackle a few of them.

The BC-614 is a fine speech amplifier and I use it with my BC-610-E. It's not mandatory you use it, but you will need some kind of speech amplifier to drive the modulator in the BC-610. Some guys use other preamps and audio processing equipment and it all works just as well. However, I prefer the BC-614 since it was made for the BC-610 and provides an avenue for PTT as well as the needed drive. It also has the "Modulator Plate" meter so it's easier to adjust the modulator bias. There is no direct microphone and/or key input on the BC-610.

As for the cleaning I use a similar solution. It is very important to be extra careful around the transformers not to let any moisture get in. If you intend to dissemble the transmitter to clean it I would suggest you study the section in the TM describing how to take it apart. It is not an easy task and may require a strong back or two to lift the individual decks.. I usually take the modulation transformer off before trying to get that deck out. Mine has a cover over the bottom of the power supply deck, so I have to remove it from the frame to service it. This is definitely a two man job! DeOxIt works great on all the contacts.

I got my crystals from Brian Carling af4k.com and they work beautifully.

I hope this helps a little.

73,
Rick/K5IZ

# 2825. Re: [T-368_BC-610] BC 614 Question

Yahoo group: T-368_BC-610
Date: 2006-12-20 17:30:33 UTC
From: James M. Walker
Topic: 2817  Message: 2825

Let me jump in here if I may,

The BC-610(*) require 600 ohm audio drive to the modulator connector
on the right rear facing the BC-610. You can provide audio drive there,
and also the pins for a 0 - 300 MA meter are on that connector. Also
the keyline contacts for CW. Called out in the manual.

As far as cleaning, first check with a rag of sorts, to see if it is dusty
or dirty but still has the "MFP" coating on the chassis surface. If so
then use simple green or 409 and a soft rag to clean the surfaces. If it has been repainted
or such that the MFP coat has been removed, then
test an small area before using strong cleaners on it. YMMV there.

The BC-614 is good I never got/get "Bassy" reports from my use,
voice characteristics usually determine that also. The PTT function
can be implemented if you use the BC-614, I built a stand-alone
box that allows me to set resting modulator current, do CW keying
and the like. It also lets me key the transmitter for AM operation.

when cleaning the contacts on RF coild and tuning units, I use scotch
brite pads and gently clean so as not to remove the nickel plating. Be
careful with the coils as some cleaners with cause the spacer forms to deteriorate, some
after cleaning with say 409, use clean water and let
air dry. If your tuning units are tough turning, open the case and lube
the ball bearings on the shafts of the caps.

Disassembly of the "E" model is a pain but do-able. First take the
top section cover off, then unplug the wires from the RF deck to the
modulator deck. Then remove all the screws all the way around the
bottom of the RF deck, but leave two in on each side of the rig. Once that
is done, have a helper pull the two pairs of screws out while you hold
the RF section, sit it off on the side.

Then comes the modulator, I cut 2 (two) 2X4 pieces to hold the modulator deck up, the
screws for this deck go thru the handles for the BC-610.
So removing them all at once is a cry for disaster. Unless you prop the deck up somehow.
Once all the screws are out of the "Mod" deck you can stand in the a position near the
middle of the deck and lift it out.
WARNING it is heavy but manageable for short distances.

To get to the power supply deck, all the way around the remaining side and front skins are
bolted to the top of the power supply chassis. Unplug
the cables to the power supply and tilt it up on the HV tranny side it won't
go over on you if you don't bang it.

If you have the transformers with the end bells, wipe everything down
or if your transformers are square and sealed 409 with vigor no sweat.

Sorry for the length, but WELCOME TO THE "Beastly" Crowd.

Fortunately the back covers are easy to fabricate. A piece of sheet metal cut to the appropriate size
with a few ventilation holes and painted black. The rear panel in place is recommended in order to
keep critters from nesting in the internals.

John,

When they were manufactured they ALL had a back panel.

The reasoning is unknown, but I suspect that owners/operators OTHER
than
the military made up their mind that the BC-610 needed to breathe more.

They DON'T! They will run 24/7 without cooling other than plain old
convection.

The JB-70 junction box that you have will make it easy to set up for
PTT
operation.

The BC-614 is more than adequate for speech amplification. There are
some that have and do feed the BC-610s with audio from another source.

Welcome to the REAL Boat Anchor Club!

From: Rbethman
Topic: 2817  Message: 2827

John, et al,

My BC-610(I) came to me without the back panel. You just have to deal with EITHER leaving it open, handling the Safety Interlock, AND keeping hands and OTHER things out of the HV, - OR - Take measurements and make either a steel or aluminum back panel. (Look at the manual. It IS available on BAMA, TM 11-826. It is 29.5 MB in size.) Use the manual pictures as a "general idea" how much ventilation is needed and where. IF you have problems with downloading from BAMA, (bama,sbc.edu look under military.), How big of an attachment can you handle?

My T-213 was received WITH the back panel.

The 1/4" jacks on the LEFT front of the BC-614 are for the mic. The top one for a "dynamic" mic, the bottom for a CARBON mic.

My experience is that the gain pots are crudded up and require restoration work OR replacement.

You have the option of connecting the JB-70 to the BC-614, then the BC-614 to the BC-610 allowing for PTT operation, OR you can eliminate the JB-70 and use the PTT "external" modification on my web site:

As posted earlier:

>I have an 80kb jpeg schematic that will plug into the (R), right hand
>connector, of the BC-614(*), to allow for PTT.
>
>This is NOT an internal modification! Original circuit by K5JV, Lon Cottingham.

# 2828. Re: [T-368_BC-610] BC 614 Question

Yahoo group: T-368_BC-610
Date: 2006-12-20 19:18:11 UTC
From: james1787@aol.com
Topic: 2817  Message: 2828

Jim,

I'll probably look around for a BC-614 to use with my BC-610 as this seems to be the easiest and best way to go. I'm going to start hunting for a BC-614. I know I've seen them around on ebay from time to time or perhaps someone on this list has an extra one that they would be willing to part with.

Is the MFP coating that yellowish color? That coating offered some sort of protection against moisture in damp environments, correct? I've seen it on a few pics of other people's BC-610. Mine does not have that. Mine looks more like any other chassis. I guess with all the printing on the metal then I should be very careful.

Most people say the BC-614 works just fine with the BC-610 and does the job. That sounds good enough for me as that's what it was designed to do!

I'll try the scotchbrite pads and some cleaner. I know about some cleaners that have an adverse effect. A friend of mine used some pcboard cleaner on his Elecraft K2 and the plastic power connector desintegrated. Perhaps simply the q-Tip or a rag soaked in the material will be enough to clean it up for years of reliable use.

Thanks for the dissasembly instructions and the 2 X 4 hint for the BC-610. The 2X4 idea is smart to eliminate the risk of any damage. If I recall watching the BC-610 video that's out on the internet they installed the decks using some sort of overhead crane to save a few backs. I'll definitely grab a friend to help dissasemble the radio for any lifting parts. From there I can inspect any wiring, clean, test and then re-install each deck. I think I'll leave the bottom deck in if I can. I can probably easily tip the frame over on its side to get at any parts underneath.

I'll file your email here for safe keeping, again thanks for the hints!

73,

James KB2FCV

Subject: Re: [T-368_BC-610] BC 614 Question

Let me jump in here if I may,

The BC-610(*) require 600 ohm audio drive to the modulator connector on the right rear facing the BC-610. You can provide audio drive there, and also the pins for a 0 - 300 MA meter are on that connector. Also the keyline contacts for CW. Called out in the manual.

As far as cleaning, first check with a rag of sorts, to see if it is dusty
or dirty but still has the "MFP" coating on the chassis surface. If so then use simple green or 409 and a soft rag to clean the surfaces. If it has been repainted or such that the MFP coat has been removed, then test an small area before using strong cleaners on it. YMMV there.

The BC-614 is good I never got/get "Bassy" reports from my use, voice characteristics usually determine that also. The PTT function can be implemented if you use the BC-614, I built a stand-alone box that allows me to set resting modulator current, do CW keying and the like. It also lets me key the transmitter for AM operation.

when cleaning the contacts on RF coild and tuning units, I use scotch brite pads and gently clean so as not to remove the nickel plating. Be careful with the coils as some cleaners with cause the spacer forms to deteriorate, some after cleaning with say 409, use clean water and let air dry. If your tuning units are tough turning, open the case and lube the ball bearings on the shafts of the caps.

Disassembly of the "E" model is a pain but do-able. First take the top section cover off, then unplug the wires from the RF deck to the modulator deck. Then remove all the screws all the way around the bottom of the RF deck, but leave two in on each side of the rig. Once that
is done, have a helper pull the two pairs of screws out while you hold the RF section, sit it off on the side.

Then comes the modulator, I cut 2 (two) 2X4 pieces to hold the modulator deck up, the screws for this deck go thru the handles for the BC-610.
So removing them all at once is a cry for disaster. Unless you prop the deck up somehow. Once all the screws are out of the "Mod" deck you can stand in the a position near the middle of the deck and lift it out. WARNING it is heavy but manageable for short distances.

To get to the power supply deck, all the way around the remaining side and front skins are bolted to the top of the power supply chassis. Unplug
the cables to the power supply and tilt it up on the HV tranny side it won't
go over on you if you don't bang it.

If you have the transformers with the end bells, wipe everything down or if your transformers are square and sealed 409 with vigor no sweat.

Sorry for the length, but WELCOME TO THE "Beastly" Crowd.
Jim

WB2FCN
http://eshop1.chem.buffalo.edu

I am still a relatively new BC-610 owner. My BC-610E has been sitting in the basement for several months now, I have finally printed out (as of yesterday) the manuals for it so I can start dissasembly, cleaning and restoration of the transmitter.

I have a few questions -

Is the BC-614 necessary to it's operation? I don't know much about this unit other than it is a speech amplifier. Is this where you would plug in a mic or key? I don't see anywhere on the transmitter where a mic or key would plug into.

As far as cleaning the insides go, I plan on using some simple green and a soft brush and carefully washing each section and allowing to dry thoroghly (heh, it'll probably get a few months to dry). Is this a good method or is there a better way to clean it? Any reccomendations for safely cleaning the oxidized contacts of the plug-in coils, TU-52, etc?

Were there crystals for it in the ham bands or is it up to us to modify crystals for it?

Sorry for all the questions!

73,

James KB2FCV

# 2829. Tuning units

Yahoo group: T-368_BC-610
Date: 2006-12-20 19:40:51 UTC
From: John King
Topic: 2829  Message: 2829

While looking over my BC-610 tuning units today, I noticed that two of them were apparently manufactured by a "Heath Co". One has 1951 printed on it and Heath Co.. The other has 1961 and Heath Co. on it and it is obvious that these markings are the original painted on letters at time of manufacture.

I wonder if this is the same Heath Co as Heathkit Ham fame?? Has anyone ever encountered these tuning units with Heath Co. on them? What do you think? They are identical to all other tuning units I have seen. 73, John, K5PGW

John,

I do not know if that is the same Heath Company.

All of my tuning units are either marked "B&W" or "Hallicrafters". Most
of the latter have the "Halli Logo" on them also.

In the Osterman "Receivers Past & Present" he mentions that Heath was an aircraft and aircraft parts company thru WWII. After the war it got into the electronics business. Maybe they did get some contract work.

There USED to be a website where someone had made a 160 mtr PA coil by
applying windings on PVC. I can't find that information.

For 160 meters, use a 2.0 - 2.5 type tuning unit. To lower the frequency
of the tuning units hang a 100pf cap on each of
the variable caps in the unit. Be VERY careful when you set the
frequency! You can get DOWN to a bit above 1600KC!

There USED to be a website where someone had made a 160 mtr PA coil by applying windings on PVC. I can't find that information.

For 160 meters, use a 2.0 - 2.5 type tuning unit. To lower the frequency of the tuning units hang a 100pf cap on each of
the variable caps in the unit. Be VERY careful when you set the frequency! You can get DOWN to a bit above 1600KC!

seasons greetings to all from chuck strozier-BC-610 owner.
I enjoy the exchange.
there is an article in 'electric radio' #.139 dec. 2000 page 14 written by gary willey w4zxs on how to fabricate 40/80/160 tank coils from scratch out of 4" PVC,
I will be glad to photo copy the article, and send to anyone wanting. just e me ccstrozier@...
regards,chuck

# 2845. WTD: BC-939A and BC-614-I meters

Yahoo group: T-368_BC-610
Date: 2007-01-08 10:11:45 UTC
From: g3vkm
Topic: 2845  Message: 2845

Hi All,

I'm in the market for a 0-15 Amp RF meter for my BC-939 ATU and I am
also looking for the 0-300ma meter for a BC-614-I Speech Amplifier.
Anyone out there disposing of such itmes?

73 for '07,

Roger/G3VKM - Norfolk, Englamd.

# 2846. WTD: Info/Manual on T-946/GRC-129

Yahoo group: T-368_BC-610
Date: 2007-01-11 20:08:50 UTC
From: John Poulton
Topic: 2846  Message: 2846

Folks,

Just had a visit from Paul Bernhardt KF4FOR from up in Alexandria, who showed me something very interesting: a portion of a T-946/GRC-129 transmitter. The T-946 appears to be a sort of modified T-368, updated for SSB transmission. It was built in the same cabinet, and shared a bunch of common parts with the T-368. There's no modulator, of course. Paul's transmitter was built by Manson Labs and is serial #88.

Paul's transmitter is in pieces and is missing all of it's iron. He would like to restore the transmitter and is in need of:

* Manual or any info on the T-946
* A T-368 power transformer
* A T-368 cabinet
* and/or a T-368 junker with above still on board

If you can help Paul out, please let me know and copy:

bern@...

Thanks, and 73, John K4OZY

# 2847. CH-88-A (for SCR-399) available FS

Yahoo group: T-368_BC-610
Date: 2007-01-28 16:08:21 UTC
From: John Poulton
Topic: 2436  Message: 2847

Anyone out there attempting to complete an SCR-299/399 or similar and in need of a CH-88-A spares chest? I happened to run across one of these while picking up some other equipment yesterday. It's finished in gray, appears to be in pretty decent shape, and includes about a dozen BC-610 tuning units. It's located near Brevard, NC, about 35 miles southwest of Asheville.

If you're interested, email me, and I'll put you in touch with the owner, who would entertain any reasonable offer for the chest, pickup only, of course.

As a sweetener, this thing is located along with TONS of other techno-junk of various kinds, all most likely for sale at a very reasonable price. A BC-767, couple of BC-939's, bunch of TTY converters of various types, and lots of other similar stuff. I hauled away a van-load of teletype parts, but there's lots left.. :)

Group,

I know T-368's are gray and BC-610's are black but the generic Milsurplus list is down and I know some members hang out here as well. The rain stopped long enough yesterday for Roadway to deliver some paint to me. 12 oz spray cans, $9.50 for 1 to 3, $8.90 for 4 to 11, $8.50 for 12+. Plus shipping by UPS Ground only which means it can only go CONUS and most of Canada. I tried for two years to figure a way to send it anywhere else but to no avail.

# 2851. BC-610-E Modulation transformer bolts

Yahoo group: T-368_BC-610
Date: 2007-02-28 07:35:07 UTC
From: g3vkm
Topic: 2851  Message: 2851

Hi All,

Finally, I have started on cleaning up my BC-610-E and checking out parts prior to a rebuild. The first step was to break the TX down to its three chassis. I removed the modulation transformer to clean it and also to make the lifting of the chassis an easier task. In doing so I noticed that the transformer was bolted down with brass nuts and bolts and that all four of the bolts have signs of wear in the area where they pass through the chassis. In all cases about 25% of the diameter of the bolt has worn away.

Should the transformer mounting have rubber washers or bushes fitted to reduce vibration? Also, has anyone else seen such wear, as I'm concerned that the transformer may have been overdriven and vibrated excessively?

Any advice appreciated.

73,

Roger Basford/G3VKM

# 2852. Re: [T-368_BC-610] BC-610-E Modulation transformer bolts

From: Rick Brashear
Topic: 2851  Message: 2852

Hi Roger,

I don't remember my "E" model mod tranny having brass mounting bolts, but I do know it has some serious talking back issues thus causing some serious vibration. I'm assuming you have the stock open frame type transformer instead of the potted type used in later models. The one thing I did that helped the "talk back" problem a little was to tighten all of the hardware holding the transformer together as tight as possible. I hadn't thought of using rubber mounts, but that may be a good idea.

Good luck and be careful lifting that monster!

# 2853. 6000 Tubes

Yahoo group: T-368_BC-610
Date: 2007-03-13 02:10:03 UTC
From: Keith Densmore
Topic: 2853  Message: 2853

Greetings
The T-368 manual says maximum driver current should be no more than 70 ma. or early tube failure will result. My transmitter draws about 75 mils and that does not give me a good feeling. What kind of plate current is average for this tube?
As a precaution, does anyone on the list have a spare NOS 6000 to part with?
Also I still need one cap screw (The large allen headed screws that secure the modules to the case.)
Thanks all,
73, Keith, ve3ts

From: Dave Bock
Topic: 2853  Message: 2854

Keith,

Mine pulls about 55 ma on the E model and about 50 ma on the F. I am down to one spare 6000 having just let one go last week. Check the screen resistor. May need to be raised a bit if it has drifted down in resistance. Just a thought. Others may have other ideas. While I have not tried it myself, some folks report good results with an inexpensive 25 volt replacement tube found elsewhere in this forum.

All,

The following originally posted 2-5-01

"The 25AV5 TV tube works well as a substitute for the 6000. Same pin-out as the 6000 but don't just plug it straight in because the plate current will be too high. The screen circuit must be modified by replacing R120 (the original screen dropping resistor) with a 15K 10W unit and adding a 25K ww pot to ground. The screen is then fed from the arm on the pot which I mounted on a bracket behind the front panel. Adjusting the pot for 25 - 30 ma driver plate current gives 10-12 ma drive to the 4-400 on all bands.

I modified my Basic as above several years ago when 6000s were very hard to find, and have been using it regularly with the original 25AV5 in place ever since."

25AV5s go for about $7 last time I checked.

Original AV5 still going strong (3/12/07).

# 2856. OUTBOARD POWER SUPPLY T-368 EXCITER/VFO

Yahoo group: T-368_BC-610
Date: 2007-03-19 01:12:00 UTC
From: W6PSS@aol.com
Topic: 2856  Message: 2856

Gentlemen:

Recently, Dennis Du Vall W7QHO wrote up a splendid hint on substituting a 12AV5 for the 6000 output tube in the T-368 EXCITER/VFO. Since then I've considered building a power supply for my exciter that I can use as a utililty VFO for any of my rigs. Then last night I heard my friend K7YOO way down the band but alas, no crystal this end.

Please, anyone who can help, kindly provide pin assignments for the multi-pin Amphenol plug/jack. If you've built an outboard power supply, I could design my power supply to utilize your pin assignments - this rather than the standard assignments that conform to the mother transmitter needs. I'll take what I can get of course. Thank you all in advance. And, thank you too Mr. Webmaster for what you do regarding this service.
73,
David

Hi,

I wonder if some kind soul on the group would let me have scans of the tuning cards that live in the pocket on the front of the BC-610? My cards are a full set but they are in poor condition and are best put away in dry storage. I know there are tuning charts in the manuals but I'd prefer a scan of the original cards.

TIA,

Roger Basford/G3VKM

Holy Profuse Expletives Deleted, Batman!

Unless the seller is merely taking an exceedingly optimistic fly at whether the Barnum Effect is this strong, it'll be interesting to see what actually happens to this.

I used to have 2 of these tuners, both in nice shape, sold one about 5 years ago because I figured I needed only 1 to go with my T-368E. I sold that one for five times what I'd paid when I lugged it home from a hamfest 15 years ago and the seller there had told me that I was the only person there who seemed to have the foggiest idea what it was for, or to show any interest in it. It was complete and nice except for a big dent in the side of the cover which wouldn't have been rocket science to fully correct.

I've kept my remaining tuner not so much because I figure I'll actually ever likely have it in the circuit between the T-3 and the antenna (unless I try it out for curious grins) as that it seems worthwhile to keep/preserve a somewhat more complete set of the original associated equipment.

But if these have suddenly become made of unobtanium that fetches a price remotely near what this guy is thinking, then I'll be happy to sell my fully intact, unmodified, 100% functional unit on the spot for $100 less than this guy is asking for his buy-it-now price :-) Funds will go towards my efforts to acuire, preserve, and eventually use other worthy historic iron of one sort or another before any of that becomes even further out of my reach.

If only I'd had lots of silly money in the early 80s and a clean barn to put things in and a confidence that someone other than me (then too young to shave) would develop a liking for quality vacuum tube electronics (at the time I lived in the shadow of Bell Labs and Fort Monmouth where plenty of the stuff was around, often cheap or free), I'd probably be in a position to retire now. Like the pristine

Hallicrafters Hurricane SR2000 with matching VFO that
I could've bought for $200. Oh yeah, and the
1 owner 1966 Mustang 289 V8 4spd with only 60K for
$1500....

I guess at least I have my personal R-390A that I am
only the second owner of (and the first wasn't
Uncle Sam) and that I bought for less than you could
probably buy a parts carcass specimen
for now. I guess it's good, too, if these prices and
trends hold, that it also happens to be in a
secure space.

You mean Irb (that's how he spelled it if I recall correctly; he was always quick to point it out).

I spoke with him sometimes on 75 when I was using my ART-13 (that I now wish I hadn't sold) during the late 80s and early 90s. To be more precise, I should say that I spoke with him until such time as I realized that it was impossible to carry on a conversation that didn't unendingly swiftly revert to his monologuish fixation on his own interpretation of what was unwrittenly-written into __The__ __Constitution__. It's not that I universally disagreed with him (although I certainly did not always agree with him). It just became a predictable bore and chore.

# 2875. mil truck question

Yahoo group: T-368_BC-610
Date: 2007-04-04 22:40:04 UTC
From: Trevor
Topic: 2875  Message: 2875

Hello T-3/ Beastly 610 enthusiasts.

I recall that some of you, in addition to a fondness of and ownership of RF-creating vintage iron, also have knowledge of (and know others with) large green internal combustion powered green iron with wheels (Joe, would you mind forwarding this to the mil-gensets list, and any of you, feel free to forward to any of the mil-vehicle lists, etc., you are on).

For the first time in almost 20 years, I stooped to practicality and am not driving a truck as my one and only personal vehicle. This is a good thing for monthly bills for basic transportation. But I can tell I will want a truck, and now am at liberty (maybe) to acquire a truck that needs make no pretense at practicality as one-and-only vehicle to drive to work, the store, or put my kid in: Solid axle 4X4, manual locking everything, all leaf spring, who cares about whether it came with a heater... Bigger than a Jeep, smaller than a Deuce. Affordable to a guy who went through a divorce, has a kid, works for a living, and has no trust fund or other inheritance.

I have no hesitancy to take on something that needs some work on things like carburetion or wiring or moderate mechanical work (maybe even missing an engine as long as I can get it home and the rest of it is really truly worth the bother), but I have learned the hard way in the past that certain things like significant rust or vehicles that have been beaten on senselessly, or bubble-gummed with botched 'fixes' turn into only one thing-- good time and money after bad.

I could care less what bad combo of color or colors it is now as long as it's all relatively unbent, un-holy real metal, and not Bondo.

Needs to be somewhere where I could get it home (VT) without unusual means or extraordinary expense.

I know I may be dreaming in the hoped-for combo of something that is both (a) affordable; (b) not in some utterly far off corner of the continent; and (c) won't fall in the British Sportscar category of requiring 20 hours of work prior to each hour of running (OK, actually lots of hours up front is even very OK if the basics are intact and sound and solid enough that I will have something to show for it and that will run relatively well, relatively trouble free, later).

But I also know that if you never ask, you never know.

I am hoping that maybe there's a lonely M-37 or something similar out there with an owner (or watcher-over) who'd rather see it go to a home of a fellow appreciator where it will be under a barn roof and gradually be used and cared for (but not parade-restored or Ebayed) instead of either being parted or purveyed for top dollar or left to fade away. Other suggested candidate type vehicles considered

please forward any leads (!! or advice on what or who I should avoid dealing with !!) to kd1yt@...

Thanks

Trevor

# 2876. 20 amp fuse wire?

Yahoo group: T-368_BC-610
Date: 2007-04-07 09:46:21 UTC
From: g3vkm
Topic: 2876  Message: 2876

Hi All,

When I bought my BC-610-E, it came with a lot of the screw-in heavy-duty fuses for the front panel. Unfortunately, there are no 20 amp versions but there are some 15 amp types that could be modified by replacing the fuse wire. In the UK, 20 amp fuse wire seems to be unavailable, domestic types are 5, 15 and 30 amps for 230 volt supplies. My question is, is 20 amp, 115 volt fuse wire easily available in the US and could anyone give me a source that will ship abroad?

Wire suppliers over here do give fusing current values for tinned copper wire but again there is nothing available in 20 amp rating, 17 amps is the nearest. I did try the copper wire table in the 1995 ARRL Handbook but couldn't see any fusing (melting) values there.

TIA,

Roger Basford/G3VKM

Question regarding T-368
Does anyone know the history behind some front panels being engraved and others being lettered using a stencil?
Wondering if the "rebuilt at depot" got a thick coat of paint and stenciled over, or if some manufacturers stenciled rather then engrave.

thanks

I am pretty sure that the engraved vs stenciled
varied by manufacturer, sub-model, or even batch, and
am almost certain that the variation was not by
whether they were rebuilt at Depot.

My B&W-made "E" which was overhauled at Pirmassens
Army Depot before going to Fair Radio, then one ham
in Canada who became an SK, then a wing-nut dealer
(the infamous Luc), then to my QTH (and I am fairly
highly confident that the decks are the same ones
that came out of the depot refurb) has at least one
engraved deck (audio/ Modulator)(which looks the
oldest of the 3 decks) but the RF deck is not
engraved. My guess is that the later variations
skipped the engraving as a cost saving measure.

# 2882. remind me where the article on the LM/BC freq meters' top secret role is

Yahoo group: T-368_BC-610
Date: 2007-04-11 00:51:13 UTC
From: Trevor
Topic: 2882  Message: 2882

Hello all-- please excuse the OT question, but I figure someone here is sure to know or give me
usegful tips. Somewhere in the last 10 years I ran across an interesting article (not sure if it
was paper or virtual) that detailed how the LM/ BC-221 frequency meters were designed, including
the development of the automated machines that printed out the unique calibration books for each
individual meter-- and the role that this precision and innovation played in the Allies' success
over fascism in WWII, how it was top secret, etc.

I've tried Google with no luck.

I have several excess LMs and one BC221 that I really simply like having around because they're
such intriguing units, and when houseguests wonder what they are (or maybe I'll bring one to the
office), it'd be fun to share the article.

Thanks & 73

From: g3vkm
Topic: 2888  Message: 2888

Hi All,

Finally got power on my '610-E today and apart from a 100TH flashing over and tripping the breaker it came up without too many fireworks. I still have a few problems, like no modulation from the BC-614-E and the JB-70-A not switching to transmit but I think these are problems caused by some modified wiring in the control circuits.

As far as I know, there's only my '610-E and another in G4GEN's SCR-399 truck that are anywhere near complete and working in the UK. I hope to get on the air in the next few days, at least on CW. My original plan after acquiring the TX in December 2005 was to be operational by summer of 2006, so I'm well behind schedule!

Thanks to those on the group who have offered advice, encouragement and spare parts from the States and Europe! There's a photo on the web site at

I'd like to confirm some measurements relative to my particular T-368A. Power out on the Bird shows 380 watts at 150ma plate current. The line voltage is set at exactly 115VAC and the filament voltage on the PA is nominal. The power out does not compute for the B+ specified in the manual nor measured when I initially measured it and put this unit on the air. What PA plate values (E and I) are others getting? Thanks much.

# 2899. M-37 radio truck wiring diagram questions

Yahoo group: T-368_BC-610
Date: 2007-05-01 16:53:53 UTC
From: Trevor
Topic: 2899  Message: 2899

Hello all-- thanks for the leads in response to my recent cross-topic post about wanting some
wheeled ex-GI iron to keep my big grey radios company.

The happy ending is that a 1951 M-37 former radio truck now resides in my barn. Basically all
intact and all stock except that a fire dept painted it red with a brush... I am viewing that as
part of its overall history, at least for the foreseeable future. Unfortunately, the R-392 and T-
195 and shelter enclosure, antenna mount, etc., parted ways with the truck somewhere in its past
before it got to me (leads on intact/ affordable GRC-19s, AB-15 antenna mounts and brackets for
the '37 most welcomed; no urgency in the search)

The good news is that the '37 has only 16000 original miles and the full set of GI maintenance
sheets showing what was done where, when, etc.

The bad news is that the charging system-- doesn't. It is a 100 amp system seeminlgy unique to
the radio truck variant of the M-37 and that does not resemble the original/usual M-37 system ,
going by the maintenance sheets, this was installed to replace the original electrical system in
about '54. It has some large finned rectifier up front behind the brush grille and in front of
the radiator. I have not been able to find any information on the usual MV/M-37 sites.

Anyone have any leads on where I could find specs and a schematic for this system that looks at a
first-glance level like a very early alternator concept (judging by the presence of a large
rectifier hung out front to get cooling air)?

If I can get some info it'll help me avoid having to dope it out blind.

Thanks and 73 and hope to meet some of y'all in person at Deerfield NH, which I plan to go to
with my 9 year old son (who _wants_ to go) in tow; unfortunately, the M-37 is not yet road-ready
for such a trip.

You should've mentioned this at lunch yesterday, I'd have pointed you to George Wild at Wild Electric in Barre. He's be in the vehicle electrical systems business for decades and could probably tell you what it is from a good description. He can also fix just about anything. He rebuilt the generators and voltage regulators for an old '56 Chriscraft cabin cruiser I had years ago, and rebuilt the starter for my '73 Land Rover, including sandblasting the inertia mechanism, for $35. He knows the old stuff inside-out, and prefers it to the new throw-away junk.

See you at Deerfield. Was over visiting Ray last night and we uncovered a nice T-3 manual for the A, B, and C models with tuner info. Any idea what he should ask for it? My guess is $20-$25, but I haven't really kept up with prices.

~ Todd

Trevor,

Stop by at Deerfield. I will be around Dale, KW1I and the mil radio guys.

Brown, W1NZR has a 100 amp system in his M37B1. He likely has diagrams and he will be in our area at Deerfield (look for the white van).

The finned thing in front of the grill is a selenium rectifier. They go bad so the rest of the 100 amp system may be ok. I believe people have replaced the selenium with modern rectifiers that fit within the finned housing.

Shelters are also available with a bit of looking.

You may want to touch base with:
http://www.vintagewiringofmaine.com/index.htm for a recommendation on the wiring documentation.

If you have not have done this already you want to Subscribe to Military Vehicles Magazine

and join MVPA http://www.mvpa.org/mambo/index.php

Congrats on scoring that fine truck!

system seeminlgy unique to
the radio truck variant of the M-37 and that does not resemble the
original/usual M-37 system ,
going by the maintenance sheets, this was installed to replace the
original electrical system in
about '54. It has some large finned rectifier up front behind the brush
grille and in front of
the radiator. I have not been able to find any information on the usual
MV/M-37 sites.

Anyone have any leads on where I could find specs and a schematic for
this system that looks at a
first-glance level like a very early alternator concept (judging by the
presence of a large
rectifier hung out front to get cooling air)?

If I can get some info it'll help me avoid having to dope it out blind.

Thanks and 73 and hope to meet some of y'all in person at Deerfield NH,
which I plan to go to
with my 9 year old son (who _wants_ to go) in tow; unfortunately, the
M-37 is not yet road-ready
for such a trip.

Hi Todd- thanks-- I've gone to Geo.Wild in the past and been really pleased with his competence
and reasonable prices, but in this instance, I am hoping that if I can get a diagram, I may not
even need his services. My instincts are that the problem is more in the electrical side of the
charging system than the moving parts. The last owner put in a new regulator at substantial
expense with no results, and so I think it's probably the rectifier-- just hoping for a
schematic/specs so that I am operating less in the dark.

I'm not sure what the going rate is on a T-3 manual; any of this stuff, original, seems to be
made at least partially of unobtanium and thus worth more than whatever it was worth

Deerfield '07 or bust; then Dayton '07 or bust! I have virtually no dough to acquire anything
much at either, but this is a good year to take in the experiences -- for once I had the sense to
block 'em out on my calendar ahead of time on a priority at least co-equal with any other
official or unofficial duties.

PS,what's the scoop on the Deerfield AM dinner?

73

Trevor

You should've mentioned this at lunch yesterday, I'd have pointed you to
George Wild at Wild Electric in Barre. He's be in the vehicle electrical
systems business for decades and could probably tell you what it is from a
good description. He can also fix just about anything. He rebuilt the

generators and voltage regulators for an old '56 Chriscraft cabin cruiser I had years ago, and rebuilt the starter for my '73 Land Rover, including sandblasting the inertia mechanism, for $35. He knows the old stuff inside-out, and prefers it to the new throw-away junk.

See you at Deerfield. Was over visiting Ray last night and we uncovered a nice T-3 manual for the A, B, and C models with tuner info. Any idea what he should ask for it? My guess is $20-$25, but I haven't really kept up with prices.

I'd like to confirm some measurements relative to my particular T-368A. Power out on the Bird shows 380 watts at 150ma plate current. The line voltage is set at exactly 115VAC and the filament voltage on the PA is nominal. The power out does not compute for the B+ specified in the manual nor measured when I initially measured it and put this unit on the air. What PA plate values (E and I) are others getting? Thanks much.

Thanks Steve--

My logistics just got more complex, as they just set the schedule for my son's first little league game for the season, and set it for this Saturday AM, starting at 10 (and since it's about a 2 and 1/2 hour between Deerfield and the ball field, that's about the worst spot in the day to try to have both fit together). He'd been really interested in going to the 'fest (we were going to go down Friday after he gets out of school, and then camp over) but now he's torn, and-- as a 9 year old guy probably should, leaning strongly towards the ball game. So I am noodling over whether to try to drive down Friday and then head out really early Sat. in order to get him to the game?

I recall hearing that a bunch of the AM gang was going to dinner around 7. I made it to Hosstraders once when it was in Rochester and a couple of times in Hopkinton, but don't have a sense of whether, if I arrive at the new NEAR-fest at around 5-5:30 Friday, whether I and my son will be likely to have enough time to be able to take in enough, catch up with some of you fellow retro-types, etc. to make it worth the drive. What y'all think?

Thanks

[PS, I just pulled the '37's grill guard to get ready to yank the slightly leaking radiator, and in the process, to also see if the rectifier unit hung on the grill guard is part of the non-charging-issue of the charging system. Without a diagram I haven't started doping out a lot in terms of ohm readings, but the good news is that the selenium rectifier looks very intact, and as if it has been very, very recently replaced. The not so good news is that at least one, maybe several, of the big female terminals of the big Cannnon Connectors on the cables seem to have been botched up a bit by someone in the past, so I may end up on the lookout for those connectors, or at least the BIG female contacts within them. Any leads for when I start chasing those [or, maybe, in the interest of reliability, I should delete the actual connection to the selenium unit, but leave it

in place for appearance, and then re-cable things
under the hood using some silicon diodes?]

Was good to see you there Friday, Trevor. The Mil vehicle turnout was great,

saw Larry's dually with radar antenna rotating on top. Saw 'Old Buzzard John' with
his truck and trailer, saw Dale on Saturday and asked, he said you two had caught
up and had a good chat, so it sounds like you made good use of your limited time.

Sorry I couldn't spend a bit more time with you and Caleb, when you came by
I was in a deep discussion with Gary, WZ1M and Joe, WA2PJP about my
zorched modulation transformer which Gary took back to Maine for rewinding.
Joe and I had to bolt after that to get to the motel for check in, then off to
dinner.

Deerfield was a huge success, greater turnout than expected or even hoped for.
We did quite well, MrMike will be releasing the figures soon but suffice it to say
that we'll be back the second weekend in October and next May. It was a fun
time, although hectic. I was busy working much of the time, but did manage a

few minutes to get the GRR-5 out onto the tailgate for some SW listening.

BTW, Ray KC1BT had a SWR unit for the T-368 on his table for $40. No idea
if he sold it. I picked up a power cord and connector for my R-390 and a
GRA-4 dipole center insulator for $5, and a few tubes. Most of us found little
time to shop due to NEAR-fest related duties.

From: Alan Morriss
Topic: 2908  Message: 2908

hell guys, my scr399 tx is an "E", serial no 706. i was after some of the wing bolts that secure the back as i only had 3.
this proved difficult, so i found an easy and elegant solution.
get some suitable screws with a slot. find washers of a suitable size, which only just will not fit into the slot. grind a flat on one side exactly the length of the slot, and chamfer the edges slightly so it can start. hammer it in, and you have something which does not exactly resemble the original, but looks the part, and works well. it is cheap and easy !
i still have not got pa current, but am sure that it is the driver stage.
i am going to check if there is ht on the 807s today when i get round to it. i suspect the choke c1. cheers, alan g4gen

# 2912. British BC-610-E (finally) on the air!

Yahoo group: T-368_BC-610
Date: 2007-05-14 15:53:17 UTC
From: g3vkm
Topic: 2912  Message: 2912

Hi All,

Just thought I'd say that my BC-610-E took to the air again this afternoon after many years of silence and a rebuild. On 3615 kc AM I worked G3MJX, G8IUC and GB2IWM, receiving encouraging reports despite the poor radio conditions. I was also using a BC-614-E with an Astatic D-104 mic and receiving on an SX-28 with a active loop antenna. TX antenna tuning posed a problem or two; I had also rebuilt my BC-939-A but it refused, unsurprisingly, to tune my doublet either with the feeders strapped or feeding a single leg. I resorted to feeding the '610 balanced output into a Heathkit B1U 4:1 balun and then fed that by coax to my normal station ATU, scope freq. and counter. That gave me the full UK legal limit with no nasty flash-overs or smoke! I've carried out N6PY's mod of bolting a 470uF cap across the driver cathode resistor and that has considerably reduced the mains hum when using the MO setting on the tuning unit, still not good enough for CW but fine for AM.

Anyway, I'm well chuffed with the results and hope to get going on the higher bands in the near future and work some of you! Anybody got the mods for Ten? [:)]

73,

Roger Basford, G3VKM - Norfolk, England.

From: g3vkm
Topic: 2913  Message: 2913

Hi All,

Anyone overcome the "buzzy" relay problem when using a BC-610? The antenna relay on mine buzzes really loudly, although it will sometimes react to a sharp tap on the cabinet near to the relay and go quiet. Perhaps the buzzing is increased in my TX due to running on 50Hz but the other relays seem happy.

Topic: 2917  Message: 2917

hello everyone. i have had the scr 399 on air for our saturday morning net and received excellent reports from all taking part. my initial troubles were in the bc 939, and i must check it.i think the meter is open circuit.
i am operating on 3615 using 66 feet of wire with one of the antenna terminals grounded.
it is a wonderful experience operating a set up which was probably used in the ardennes offensive.
now, can anyone help me. i am after an xtal for 3615, and i believe someone in the states does ft 171 xtals. does anyone know their site address ?
the other thing i need is the special coaxial plugs for the bc 312 and 342.
as you can imagine, i am really happy !

Hi Steve and welcome to the group. I don't think a metal plate on the bottom of the power supply deck is mandatory although it is a good safety feature. However, since yours sits on the wooden dolly it would not be accessible by animals or little fingers so you are most likely fine.

73,
Rick/K5IZ

Topic: 2919  Message: 2922

BC-610-A through T-213/GRC-26 came with one or the other of two bases, although most today are found without either.

The more common was the shockmount base. The main part of it looks from both front and rear like a shallow set of stairs. The transmitter sits on it and is bolted to it from the outside of the power supply chassis. When you do find one of them today, more often than not the actual shock mount bars are missing.

The less common is the roller base, used at shore stations, mostly I think by the Navy. At least the only ones I ever saw or had were at or came from Navy installations. The transmitter sits down into it, but isn't actually attached to it.

# 2924. 4-400A

Yahoo group: T-368_BC-610
Date: 2007-06-10 16:51:37 UTC
From: Mike Feher
Topic: 2924  Message: 2924

I have some 4-400A and 4PR400A tubes NOS/NIB for sale. The 4-400As are $90 each and are made by Luminetrics in the UK and the 4PR400s are $125 each and are made by Eimac. The only trick is, they have to be picked up. Of course if you do decide to come over be ready to possibly go away with an R390 or an R390A or an RA-17, or, even a T-368E or F, I do not remember if it is an E or an F, and it is down in my 2000 sq. ft. basement which I would like to use again. Also, hundreds of other receivers and transmitters of all sorts. I also have a ton of early wireless, telegraph, and about 100,000 tubes. Additionally, a lot of WWI & WWII military gear, some new in boxes. I am not ready to have a hamfest here, but would prefer to dispose of the majority of the equipment as I can. Therefore, if anything interests you, please call, as I want to limit the number of people here at one time to no more than two, as there is just way too much stuff. After all, this is NJ, "The Sue Me State" and I do not want people getting hurt. I am sure some of you understand. 73 - Mike

# 2925. Microphone plug for BC614 speech amplifier

Yahoo group: T-368_BC-610
Date: 2007-06-12 00:09:20 UTC
From: Steve
Topic: 2925  Message: 2925

Hi
Does anyone know how to obtain the 3-pin microphone plug for the BC614 "dynamic mic" input? It is not an XLR. Is it an Amphenol 91-MC3M?
Also, there is also a "carbon microphone" socket, which seems a standard 1/4 inch phono plug. But I cannot find that input on the schematic. Can a D104 go to either of these inputs?

Thanks

From: Mike Feher
Topic: 2925  Message: 2927

Since my initial post of items for sale I have been deluged by phone calls and emails. Several have made appointments already, but, most want lists and descriptions. The quantity of items here is more than enough to fill a small hamfest or antique radio meet. There is no way I intend to or can describe it all. If I were to do that, it would take forever and I mind as well put it on ebay. The idea was for people to come and enjoy themselves and find bargains and haul stuff away. Just like a hamfest, except that first come first served goes. Not to worry however, as there is more than enough to go around. Obviously I am looking at the local folks, but I have had people here from as far as California to the west and Europe to the East. My phone number is below. Regards - Mike

Hello Steve,
I would not recommend using a D-104 unless it has a Carbon Mic element.
Otherwise, you may destroy the D-104 element.
If the radio says that it is a Carbon Mic jack, then it has a DC Voltage that could be as much as 95 volts to activate the carbon granules in the microphone element. In fact, that voltage may have been much higher-up to maybe 135 volts on some of our fixed radios that used the T-17* microphone. This was back in the 60's when maintaining the Collins GRT-3 (T-282 UHF Transmitter), GRC-27 (T-217 UHF Transmitter), etc. Note: * The T-17 hand microphone was common to many radios both ground, shipboard and airborne. There was a family of the T Series microphones which I think were all carbon. It would be nice to find a Spec or Data sheet on these microphones to compare their specifications. If anyone has some of this info, I'd sure be happy to hear from you.

Glen,
The BC-614 has an input for a carbon mic and a dynamic or similar mic. It is perfectly safe to use the D-104 in the proper input, I have done it for years.
Rick

Steve,

If the top, (Dynamic) microphone connector on your BC-614E is a three pin connector - SOMEONE modified yout BC-614E.

BOTH microphone connectors on the original BC-614(x) speech amplifiers are 1/4 in plugs!

Bob - N0DGN (1 BC-610 and 1 T-213 [right out of depot crate!])

You are so right about the dynamic mic pots. I finally broke down and replaced the one I use the most. What kind of mic do you use with your BC-614? I have an old T-38E (candelabra style) that I'd like to use, but I get such lousy reports on it I go back to the D-104. I was mistaken when I said the carbon mic used a 1/4" plug, it's actually that slightly smaller one that I can never remember the number of.

Rick

Rick,

My bad!

My BC-614E has the three pin connector for dynamic. My BC-314I has a three pin AND a 1/4" jack for the dynamic.

I've been so used to using the 1/4" jack that I 'overlooked' the three pin connector.

Biggest issue I've found with BC-614s is that the dynamic mic pot is ALMOST always bad.

Uncle apparently always used carbon mics!

Cool! The Shure 737 is a strange beast, but it sounds like good technology. I'm sorry to say I don't have a source for the pot. I robbed one from another BC-614 that was in better shape. If you locate them, please, let me know. I'd like to have a couple spares.

Rick

I either use an un-amplified D-104 OR I have a Shure 737A. The Shure REALLY gets good audio.

The Shure 737 is a 'strange' beast, but definitely UNIQUE! There is a diaphragm, but it is connected to a REAL crystal that is attached at one end, and the other end is a lever that attaches to the diaphragm. This is NO Rochelle salt 'crystal' microphone!

My only other choice would be to break down and go for a Shure 55.

Where did you find the pot for the dynamic mic gain? I need one.

Group,

Originally, all models of the BC-614 (from -A through -I), besides the two octal connectors, have a 3-contact Amphenol 91-PC3F for the dynamic micrphone, a 7/32" dia. 3-circuit JK-33 for the carbon microphone, and a 1/4" dia. two-circuit JK-34 for the key. In addition, -A through -D plus -F have a six-pin receiver sidetone connector. Any deviation from that is a ham, not military, mod. I.e., a hack.

# 2936. HO 17 shelter

Yahoo group: T-368_BC-610
Date: 2007-06-15 14:57:04 UTC
From: Alan Morriss
Topic: 2936 Message: 2936

hello everyone, i just thought i would let you know how we are getting on with the shelter.
the roof is plywood inside, with an early sort of fibreglass on top. ontop of thos are thin laths, and it is covered with canvas and painted. there are formers back and front, and at intervals to nail the laths to.
we are treating it like any other building job, and replacing the wood where it is rotten. most of it is in excellent condition, but the front and back formers had to be replaced. as well as a few others. we are using treated timber, so it will last 100 years.
the sheeting over the back and front formers is tin plated, and in pretty good shape. we have treated it and painted it with red oxide.
the roof is now ready for the canvas, which should arrive today.
the shelter was painted in a light green by the luxembourg army, but underneath it is standard olive drab. we have gallons of that !
what i would like to know is what lettering was originally on the outside which may have been painted over. if there was any, i would be grateful for details.
we are not going to repaint the interior, to keep it's historic importance.
it was supposed to have been used during the ardennes ofensive, and left behind in luxembourg.
any pictures of inscriptions , if any, would be much apreciated.

cheers, alan g4gen

Hi,
This is kind of a dumb question but if I have a BC-610E, do I need a BC-614E to match and work with my 610 or will a different letter work, such as a BC-614D? Also the same goes with Antenna tuners... do I need to search exactly for a BC-939E or will any of the others work fine?

73,
James KB2FCV

Hi James,

That's not a dumb question at all. You can use any of the series of speech amps and/or antenna tuners. I used a 614-C with my "E" model for some time because it had a PTT lever switch on it. Finally, I decided to make my own PTT and went with the original BC-614-E. Best of luck with your 610 they are fantastic transmitters!

73,
Rick/K5IZ

Subject: [T-368_BC-610] BC-614

Hi,
This is kind of a dumb question but if I have a BC-610E, do I need a BC-614E to match and work with my 610 or will a different letter work, such as a BC-614D? Also the same goes with Antenna tuners... do I need to search exactly for a BC-939E or will any of the others work fine?

73,
James KB2FCV

James,

The BC-614-E, G and later are all interchangable. The major differences are in how the major components were made, such as hermetically sealed meter and transformers in the later models. And when. The -F and later are post-war. There are differences in the BC-614-A through D and F that make them not exactly plug-n-play with the BC-610-E, although you could adapt any of them.

There were only two models of the BC-939 made, BC-939-A and BC-939-B. They are interchangable although all of the -B's I have seen have had post-war Order dates. And some may have an SO-239 installed.

# 2942. Smoke testing the BC-160

Yahoo group: T-368_BC-610
Date: 2007-07-07 18:20:50 UTC
From: Steve
Topic: 2942  Message: 2942

Am almost ready to apply filament voltage to the BC-610. Assembling the various chassis to the front panel is much more complicated than I realized, since you cannot mount the front panel until the side panels are mounted, and all the interconnections have to be made before-hand. So there is some guess-work.

Here are my questions before I continue:

a) Relay RY-4, which "shorts the antenna" when not transmitting. Can't figure this one out. There are wires from terminals 7 and 8 of TS13 on the modulator deck which have been cut. (not just disconnected). Is this the 110 volts to activate the relay? Is this connection needed? What is the best way to rig up an antenna change-over relay for a receiver?
b) A mystery red wire on terminal 9 of TS9 on the modulator deck. This is not connected to anything, and I don't know where to connect it. The manual does not indicate it. In fact, the manual shows the cables from TS 1 on the RF section connected to terminals 1-11 on TS9, with no extra wire on terminal 9. I skipped 9 and connected them on 1-12.
c) How to find out which model of the BC610 it is? The manual is for "H" or "I", but the modulation transformer is cylindrical, looking very different from the pictures of the "H" and "I". I just know that it is not an "E" because of the appearance of the front panel.

Any help will be much appreciated.

Thanks and 73
Steve WA2DTW

Yes, terminals 7 & 8 of TS-13 carry 110 VAC to the antenna shorting relay coil. The connection is not actually required to operate the transmitter. But if you do not re-run the 110 volt wires to the coil, you need to disconnect the two wires that run from the plate tank coil jack bar to the relay NC contacts. Otherwise, the output will be shorted.

You can rewire the relay as a change-over relay but (a) in CW it will be energized whenever you turn on the HV and (b) in PHONE there might be some arcing when you key the transmitter as the relay isn't a particularly fast one.

According to TB SIG 220 on BC-610-F, TS1, terminals 1 through 11 connect to TS9 terminals 1 through 11. Nothing on 12. Terminal 9 is the R.F. Bias. A wire is shown as running from the wiper of R11 to TS9-9 to TS1-9 to TS2-5 to position 2 on SW8.1 (also to R26, 27 & 28).

I think that you have a BC-610-F, made by Bogan. I had one once (still have some of the parts). All of the transformer cans except for the main HV transformer are cylindrical. Only model I know of like that.

# 2945. T-368 Vacuum Relay for Antenna ChangeOver

Yahoo group: T-368_BC-610
Date: 2007-07-09 00:01:38 UTC
From: kx4r
Topic: 2945  Message: 2945

Does anyone know if there was a MWO concerning the modification of the early model T-3's for a vacuum relay like in the E model ? If so I'd sure like to get a copy.
I have a T-368C Crosley and would like to change to a vacuum relay in order to get a bit more reliable operation. The open fram relay in there now has been a problem since I've had it.
Thanks, Greg KX4R

# 2946. JB-70-A and BC-939-A parts available

Yahoo group: T-368_BC-610
Date: 2007-07-09 15:50:42 UTC
From: g3vkm
Topic: 2946  Message: 2946

Hi All,

I was at a military radio auction yesterday and picked a JB-70-A and a BC-939-A in very rusty condition. The JB is well past redemption but the big socket, the start/stop switch, overload trip and the relay are probably worth salvaging. I bought it only for the fancy octal plug that goes to the BC-614.

The 939 has no meter, I only bought it for the turns counters for a replica AT-2 project - but most of the other bits are there, including the vacuum caps, knobs and switches.

Anyone interested in any parts? If so, contact me off-list. Postage from the UK for the big coil might be pricey but the other bits shouldn't be too bad. Photos available.

Topic: 2763  Message: 2948

Keith,

The tuner description explains it all - it matches long wires and whips - period. For coax-fed antennas you can use a traditional high power antenna tuner but not the BC-939.
To use the BC-939, just toss out a long wire and a good ground system, and you'll be in business... Repeat - it won't work with a dipole!

Yes it would - but it'd be really silly - with a 9:1 unbalanced-to-unbalanced matching transformer, pretending you have a whip connected. Connect the low impedance side of the transformer to the tuner and the high impedance side to the coax.

Appreciate your new-to-you tuner as a part of the complete unit, and as something that might be
fun to try someday with the types of antennas that it was built for.

But it'd take way too much drilling and blasting to turn it into something fit for coax-fed or
balanced open-wire antennas, and even then, it wouldn't be as easy-to-use or effective as something you could buy or build for more typical ham applications.

I do wonder, though I am not recalling the exact schematic, whether one might be able to take a
twin pair of BC-939s and set them both on some insulating base, and then use them back-to-back,
with a balun at the inputs of the two tuners, as a very wide-range balanced tuner. They wouldn't
be very user-friendly to tune, but they'd probably cover a huge range of potential impedances,
huge power-handling capability, and maybe be very efficient at it.

> Keith,

You must remember that it was designed for the BC-610/T-213 radio series.

It *really* does not lend itself to tuning dipoles.

It was meant and designed JUST for those specific radios *AND* the U.S.
Mil whip antenna *OR* the specific length of wire for the band segment
as indicated by the manual or cards in the front panel holder.

The BC-610 / T-213 can handle a specifically cut dipole for a particular
frequency *WITHOUT* the BC-939.

The BC-939 was designed for the *MOBILE* work to use either the whip on
*ANY* of the frequencies it was designed for, or what according to the
manual "long wire", which for a ham perspective is a *REAL* misnomer!
The wire lengths specified by the manual and cards is either 44 feet or
77 feet.

There is no place in the Ham Radio world where those lengths ARE
considered LONG WIRE ANTENNAE.

Get or build an Ultimate Transmatch or a Heath 2036 AT if you want to
match Ham equipment to 'classic' dipoles and the like.

The TM uses about 15 pages to describe the power supplies. They contain
much more than just DC sources.
There are also power supply components in the modulator drawer.
There are protective circuits, etc. also. What in particular are you
wanting?
I have a mint condition TM 11-809-35 covering models T-368, A,B,C
Also Change Order #2 covering models D and E.
I worked on these in VietNam 1966-68 era.

Hi Erik,

My 610's will produce a little over 400 watts of carrier, but I run them at 350 to 375 watts. Combined with 100% of the great plate modulation they have it's very easy to get 1500 pep. Be sure to use a scope to check for overmod.

73,
Rick/K5IAR

Before the PEP Power output ruling change in 1991, Ham Radio operators could run as much as 1kW DC Input to the final stage. Didn't matter what mode.

If you figure 75% efficiency for a Class C amplifier, that means that with 1000w DC input to a Class C final, would equal about 750w of carrier output.

Yes, if you modulate the kW DC input to 100% with a sine-wave of 1000Hz, the PEP output of that 750w is 3kW PEP.

T-368's and BC-610s typically run between 300 and 400w of carrier output, depending on loading, antenna conditions, etc.

*IF* we were to modulate our rigs with sine-waves, then everyone would strive to run 500w DC input, at 75% efficiency, for 375w of carrier output.

Carrier output x 4 = PEP output

375 x 4 = 1500w PEP. (because as the voltage doubles in the final, so does the current)

The big hitch with this is, we don't talk in sine-waves, do we? No, we use much more complex speech patterns. Not to mention that the typical male voice is rather asymmetrical. Meaning, the amplitude of some of our natural speech peaks are not symmetrical with their corresponding lows.

Think of a rock being tossed in a pond. Out there on the edges, near the shore, the resulting ripples are rather symmetrical, aren't they? One big nice even circle, waving across the water. However, if you go back to the event of the rock hitting the water, the even is -anything- but calm. The same thing happens when our voice hits the diaphragm on a microphone. 6 to 12" away, the only thing the mic gets is the calm symmetrical waves. You can also sound like you're in an echo chamber. But, when you're up close to the mic, the natural asymmetricalness of the typical voice shows up at the diaphragm. If your speech equipment

is designed properly, and proper phasing of the audio is followed through the whole audio chain, right down to the grids and plate caps on the modulator tubes, the asymmetricalness of your voice will appear on the plates of the final output stage of your transmitter.

Several AM Audio engineer-minded hams collaborated together, and wrote an article about this.

Read it all at: http://www.qsl.net/wa5bxo/asyam/aam3.html

Erik,

With the house power panel voltage being at 126 VAC, (approx.), *and*
these radios were meant for 110VAC, I find that I *must* dial things
down a 'tad' to keep it inside the 1500W PEP.

I did NOT know what it was REALLY hitting until I got a newly calibrated
Bird with the peak reading feature.

Let's just say that I'm *very* thankful that I got the Bird *before* the
FCC came through the area and did some checking.

Bob - N0DGN

Bob,

Interesting, just what kind of PEP values were you seeing, something around 1700 maybe? Don't see how one could get into too much trouble with a 368 or 610 as neither rig has enough has enough audio headroom to push much above the legal PEP limit even with a grossly "asymmetrical" voice waveform. Not sure anyone is watching anyway, given the increasing number of ex. broadcast and HB 2 X 4-1000A rigs in use on the ham bands.

I'm inclined to agree with Dennis. The FCC of today isn't the technically competent FCC of WW-II and the 50's. It consists mostly of lawyers and Civil Service clerks. And the lawyers can't even spell PEP. But they sure love BPL.

Dennis,

I found the 1500W slug inadequate. Since meters are "normally" most
accurate around mid scale, I obtained a new 2500W slug.

The same radio, nothing else changed, and I was hitting very close to 2000W.

That's why I said I have to keep the BC-610 dialed down a 'tad'.

# 2963. For IMMEDIATE Sale: (2) BC-610 (Albany NY)

Yahoo group: T-368_BC-610
Date: 2007-07-25 14:36:35 UTC
From: bearlabsusa
Topic: 2963  Message: 2963

Hi Folks,

I have TWO BC-610s for immediate sale.

One BC-610C and one BC-610E.
Both will require a complete strip down and repaint in all probability.

Will see one or both.

For complete details:
http://amfone.net/Amforum/index.php?topic=11608.0

Email me with any questions, be patient, I may not be back online
until the weekend(s)... This is PICK UP ONLY. I can consider delivery
within about ~150mi for a real but reasonable fee.

Serious inquiries preferred, WILL CONSIDER TRADES (working, non
working, but some stuff I'm just not interested in, ok?)

_-_-WBear2GCR

email to bearlabs at netzero dot com <--- or via the link through yahoo.

hello guys, herewith the photos from the war and peace show at beltring in kent uk. it is the largest military vehicle show in the world, and people come from all over with their vehicles. we used the whip antenna and the bc 939. as we have not yet got the pe 95 going properly. a commercial 3 kva generating set was used. this ran it fine although the lights in the shelter dimmed every time the tx was keyed .
during the 6 days we were on air, many uk ststions were worked on the am frequency of 3615 khz. good reports were received in every case with compliments on the audio quality being frequent. one person put an analyser on our signal, and said it was every bit as good as his local radio station !
we also used 20 metres cw many contacts were made including as far as russia and hungary. all reports were s 9, so i made a real effort to get across the pond. unfortunately no canadian or us stations were even heard.
when using cw the reports on the keying are always good, so it speaks volumes for the old 610. i personally get a great kick from operating out of the shelter like this, as if the history we got from the luxembourg museum is correct it was used during the ardennes offensive, the battle of the bulge. i can well imagine the sort of traffic that must have gone through it.
during the war i more or less lived in the army camp here where we had canadian and us troops.many of the vehicles had characters from dogpatch painted on them ,so we will do the same. i was a great devotee of that cartoon strip, and used to scavenge the camp incinerator for comic books before they were burnt.
it is strange, but i always fancied the little ladders they used to get in and out of the radio trucks, so just before a unit left , i borrowed one, and of course never gave it back. i still have it, and now we have the truck to go with it ! cheers, alan g4gen

# 2976. Power Connector and Other Info Requested

Yahoo group: T-368_BC-610
Date: 2007-08-22 17:19:25 UTC
From: Todd, KA1KAQ
Topic: 2976  Message: 2976

Yes, well...the time has come for me to deal with the T-368D in preparation for use as the 'Classic AM' station at NEAR-Fest II. Haven't done a thing with it since receiving it last October, beyond powering it up and promptly dumping the overloads and house breaker when I flipped the PLATE RELAY switch up.

First thing it needs before going further is a decent power connector set up. Someone swapped out the original for a 2-prong Cannon connector with pin spacing such that the plug has arc tracks between the metal case and one of the holes. Curious to know what the consensus is as to the best connector to use. I'm guessing something along the lines of a 3-prong twist-lock Hubbell type or ? I'd like to go with something that at least looks close to stock with respect to the cabinet mount.

Second thing will be to figure out what's causing the big BANG noise when I flip the Plate Relay switch up. I learned about the interlock issues a couple decades ago, but never having a transmitter in front of me to play with, couldn't do much beyond trying to visualize.

Lastly, I'd like to locate a few bits for it. None of it is required for getting the thing set for NEAR-Fest, of course.

First and foremost, a shockmount base would be great. It's currently mounted on casters in place of the shocks, but this makes it a bit too tippy for my liking. And while these mounts probably aren't terribly common, you don't know unless you ask. Surely someone has a few spares kicking around the garage? Workshop? Kitchen? In the trunk of the trusty KIA Rio?

Also need to get the little side pouch for the data cards. Not that I have the book or cards to go inside, but it would be good to use the holes on at least one side if the cabinet for something useful. I mean, how well can I expect it to work if this pouch is missing?

Equally vital are the mounting studs for the antenna tuner and whatever else was on top. I don't have the 'correct' gray unit (939B?) for it, but do have the earlier black model that paired up with the Beastly 610 to trade off someday.

BTW, this transmitter hasn't been on the air for a few years. It was last used by a fellow in R.I. who later sold it to my friend Dave, W1DEC, who gave it to me last October as a wedding gift. Since Dave is planning to attend NEAR-Fest, I figure the least I can do is have his old transmitter working? That's the hope, at least.

Thanks -

~ Todd/'Boomer' KA1KAQ

Todd,

I can't believe you pirated a T368 right in my back yard. When did this happen?

I'll shoot a pix on Friday of my power connector and how I rigged it with the green wire to ground/chassis.

Same for the top studs/nuts/bolts.

As for the arcing and sparking big bang when you throw the switch... can you remember if this was up above in the RF deck or down below?

Was it upon key-down or simply throwing the relay switch? Did it remain operable or pop the breaker?

You are certainly invited to wheel that rig over to the Military Radio area at NearFest for a 0500 checkin to the 3885 MilRad net.

In the trunk of the trusty KIA Rio?

Also need to get the little side pouch for the data cards. Not that I have the book or cards to go inside, but it would be good to use the holes on at least one side if the cabinet for something useful. I mean, how well can I expect it to work if this pouch is missing?

Equally vital are the mounting studs for the antenna tuner and whatever else was on top. I don't have the 'correct' gray unit (939B?) for it, but do have the earlier black model that paired up with the Beastly 610 to trade off someday.

BTW, this transmitter hasn't been on the air for a few years. It was last used by a fellow in R.I. who later sold it to my friend Dave, W1DEC, who gave it to me last October as a wedding gift. Since Dave is planning to attend NEAR-Fest, I figure the least I can do is have his old transmitter working? That's the hope, at least.

Thanks -

~ Todd/'Boomer' KA1KAQ

> I can't believe you pirated a T368 right in my back yard. When did this happen?

Actually a number of years ago. Dave W1DEC (a new neighbor of yours, BTW) picked it up from the guy who was using it down there. The T-3 Musketeers (W1RC, W1DEC, myself) were all in the market for transmitters from the turn of the century or before. Mike was given one out of a garage in Burlington, Dave and I took the afternoon off one summer day and used my truck to help him collect it. Dave later bought this D model from someone in your neck of the woods. I found a nice RF deck, but it never filled out.

Jen and I were married last October and Dave attended the wedding. While the radioheads were gathered around a table at the reception admiring the RCA 77 mic that Joe 'PJP gave me, Dave announced that he was giving me his T-368. So I can't claim the credit for pirating it from under your nose, which I don't think is even possible! Though it would look good on my resumé!

> I'll shoot a pix on Friday of my power connector and how I rigged it with the green wire to ground/chassis.

Thanks, I appreciate that. I'm somewhat familiar with the studs and wingnuts, just not sure were to find them. Especially those wide hexnut-looking spacers Robert mentioned.

> As for the arcing and sparking big bang when you throw the switch… can you remember if this was up above in the RF deck or down below?

No idea. There was probably a big flash, but I was bent over throwing the Plate Relay switch and didn't see it. The noise was more than enough notice. I didn't get far. No key-down (didn't even have a mic attached), no anything. Plugged in, powered up fine, idled for an hour or so, checked different things, threw the Plate Relay switch up and POW. Everything went off, including the house breaker in the basement.

> You are certainly invited to wheel that rig over to the Military Radio area at NearFest for a 0500 checkin to the 3885 MilRad net.

Yeah, I'll still be sleeping at that time if I'm lucky. But thanks for the offer. We're planning to use it as part of the AM Special Event station at NEAR-Fest II, the classic tube station to compliment 'QIX's Class E station. If I get it going, that is. I could hire you to come up for the weekend to get that and the 300G on the air, then send you home with a load of stuff. Less for me to move!

~ Todd

Thanks, Robert. That does sound a lot better. I've seen pictures in
the past, IIRC, they're shorter than the 939?

Good to know. I think they're the same, was looking at MrMike's E
model when I was over there last week, they looked the same as the
BC-610s I've seen. As you say, it's the spacers that will be the hard
part to find.

> BTW, I never paid any attention but what was the original AC input
> connector on the T-368?

Something along the lines of a Hubbell 7565 I think? From memory, 2
curved prongs instead of three. The male chassis connector is recessed
with metal ears holding it to the cabinet. Female plug has a metal
casing around it. I recall an issue with substituting a grounding
version, but can't remember exactly what. All I know is the Cannon
connector on it now is not a healthy choice.

Sounds like you've got a hard short somewhere in the HV circuits. Bad rectifiers can do this so not a bad place to start. Back at a previous QTH I ran my T368s off a very "stiff" primary source (short #10 run to a 400 amp service) and depending on what part of the hysteresis loop the plate xformer core was in when last turned off and what part of the cycle the line was in on turn-on keying the rig could pop both PS breakers. Would do this maybe once out of 20 key-downs. No problems here with a longer run to the main breaker box.

On the power connector question, the original setup was a 2-prong with no provision for a green wire. I replaced with a grommet plate and a permanently connected 6 ft. line cord.

Good luck and keep one hand in your pocket when working on this thing.

Thanks, Dennis -

That was where I planned to start this weekend, by removing the 3B28s
and seeing if it still goes bang. The arc path on the Cannon connector
is troubling, too.

Good news is that even if the plate transformer is bad, I have a NOS
spare. Bad news is, I'd still have to change it out!

IIRC, your T-368 was used at one of the last Gaithersburg FARFests
back in the late 90s? We're hoping to do the same thing at NEARFest.

Begging forgiveness in advance if this post is too far off topic.

I have a nice RCA VOLTOHMYST WV-77E VTVM which is surplus to my needs & requires a good home. Works good, looks OK. Tubes good. Battery, paper caps, and out of spec resistors have been replaced. Includes manual copy. No probes.

Price/shipping is very reasonable. Contact me direct for photos, more info, etc.

Thanks and 73

Hi Todd,
Ah Boomer, you know who you are. First thing to check, and it will sound silly, is the plate current meter. See if it sits back from the front panel by a spacer, which is usually wood but may be lexan or some non-conductive plastic, that can handle high voltage.

Second, you can get a three prong AC connector male (chassis) and fermale (cable) type at grainger equipment, they also have the three wire cable. Make sure you get the Non-grounding type if you are making the thing like original. WHat you want is a cable that can handle 30 amps without bursting into flames.

There is a mention in the T-368 manual about running the HV transformer directly off of a 115 VAC variac so you can control the power output. Read it carefully, before making changes.

The bolts for mounting the TN-339 are 1/4-20 as is the the metal standoffs which are the 1.25 length type, and you will need four star washers, and four 1/4-20 wing nuts and 1/4 flatwashers. that will hold it, from the original drawing.

If you find there are no direct shorts on the HV line, check the HV "shoe" in the RF compartment left side facing, and see if the shoe is bent and touching ground.

I can look up the part number for the power connectors if you can't find them. Also the blower motor has replace-able bearings if it is noisy.

The shock mount base is similar to the one used on the BC-610(D) thourgh (I) models they are quite heavy, if you are suffering tip-over problems, consider a firniture from Harbor Freight, they can handle the weight, and the rollers are spaced such that when the unit is centered on the mover it won't tip over. Works great for BC-610s also.

If the rig hasn't been on in a while, check the blower under the 4-400, since if it was used in a home there may be 'fuzzies' traped under the chassis where the blower is, which decreases air flow past the tube.

Last but not least, check the OA2s on the mod deck.

Yes, well...the time has come for me to deal with the T-368D in preparation for use as the 'Classic AM' station at NEAR-Fest II.

Haven't done a thing with it since receiving it last October, beyond powering it up and promptly dumping the overloads and house breaker when I flipped the PLATE RELAY switch up.

First thing it needs before going further is a decent power connector set up. Someone swapped out the original for a 2-prong Cannon connector with pin spacing such that the plug has arc tracks between the metal case and one of the holes. Curious to know what the consensus is as to the best connector to use. I'm guessing something along the lines of a 3-prong twist-lock Hubbell type or ? I'd like to go with something that at least looks close to stock with respect to the cabinet mount.

Second thing will be to figure out what's causing the big BANG noise when I flip the Plate Relay switch up. I learned about the interlock issues a couple decades ago, but never having a transmitter in front of me to play with, couldn't do much beyond trying to visualize.

Lastly, I'd like to locate a few bits for it. None of it is required for getting the thing set for NEAR-Fest, of course.

First and foremost, a shockmount base would be great. It's currently mounted on casters in place of the shocks, but this makes it a bit too tippy for my liking. And while these mounts probably aren't terribly common, you don't know unless you ask. Surely someone has a few spares kicking around the garage? Workshop? Kitchen? In the trunk of the trusty KIA Rio?

Also need to get the little side pouch for the data cards. Not that I have the book or cards to go inside, but it would be good to use the holes on at least one side if the cabinet for something useful. I mean, how well can I expect it to work if this pouch is missing?

Equally vital are the mounting studs for the antenna tuner and whatever else was on top. I don't have the 'correct' gray unit (939B?) for it, but do have the earlier black model that paired up with the Beastly 610 to trade off someday.

Thanks, Jim -

I'm going to spend a bit of time with the rig this weekend, meant to get a good look this week but been too busy, getting home late, etc.

I can tell you this much: the meter is *not* recessed an inch or two like many stock models I've seen. It sits right up in the panel like the others and is a very nice match. So I'm thinking it's already been addressed. Maybe 5-7 years ago it was on the air in use, then Dave made a deal for it but before he picked it up the HV problem developed.

As far as the power connector goes, I'm not as concerned with originality as I am with safety. I mainly want to get something that looks and fits like the original, but a safer version to allow for proper electrical grounding. I've seen a few from Hubbell and others, just none with the metal apron for chassis mounting. So plastic/nylon will have to do.

Joe sent along the info on the spacers also, they seem to be the odd part to find. Another list member thinks he may have some spares, if so I'll pick up the rest of the hardware from Robert and be good to go.

Which leaves the side pocket/pouch and shockmount to locate, neither of which are terribly important in the near term. Two friends have offered their bases as templates if I want to get one welded up. Spare time being what it is these days (non-existent), it can wait a while.

Oh yes - blowers. The 4-400 deck blower is in place and works fine/quiet. The Boeing 707 rear blower is AWOL, but I think there's a spare in one of the parts boxes. Not sure I'll need it immediately, but eventually something will get installed in there.

I'll report back on what I find. Many thanks to all!

## 2985. Try this, Todd:

Yahoo group: T-368_BC-610
Date: 2007-08-24 21:36:11 UTC
From: redmenaced
Topic: 2985  Message: 2985

This is from the FILES section of this list:

Updates and additions appreciated:

The interlocks will be the most failure prone item
that needs to be checked first.

Mine ALL needed attention. Check for burned wires,
poor alignment, bent decks, squashed springs, burn
marks on the contact surfaces. These will be reliable
if taken care of.

Next is to clean, then clean, then clean some more.
All of the HV ceramics should be cleaned to remove any
oily stuff that will conduct.

Check all the spark gaps on the HV components, set
them according to the book. Check the HV wire on the
power supply deck for cracks or dried out insulation,
especially where it goes through the holes in the
deck. Big problem there, the older decks ran both
wires through one hole, the newer ones used separate
holes for each wire. Arc overs in these holes are
tough to find!

Clean the plate coil to remove anything that will
conduct, spiders, dust, etc.

Check all of the HV wire for bad, pinched, or cracked
insulation.

Check the wiring harness where it runs behind the deck front cover
bolts for pinched places.

Check the antenna relay for corroded connections, my
decks were ok, but I think my cabinet got into some
salt water somewhere as all of the antenna relay
connections were corroded like they'd been on New York
highways in the winter. Also, check the relay for proper voltage,
it's different between models. Make sure your cabinet has the right
modules in it.

Oh, ... check the HV wiring and insulators to see that
they're clean and in good shape,..... did I mention
that yet?

Check the pick up shoe on the RF deck for a good
contact and alignment.

Check the BNC connectors on the speech amp for solid ground, check all of the audio line for good grounds on the stuff that is supposed to be grounded. This is where ultra-sonic modulation starts, not good.

Install a new three wire, 10 gauge power cord and make sure its grounded well inside the transmitter. I removed the plug on the back and put a 1 1/4" X 3/4" Plumbing reducer in the hole held in with a 1 1/4" electrical lock nut. Inside that I put a Kellem-type strain relief connector sized for the 10/3 cord.

This should be connected to a 30 Amp 120 volt circuit. Well grounded, of course. Check your NEUTRAL bar connections to see if they are tight, this type of load will put a lot of current on the neutral in your panel.

And then if you get that far, check the HV insulators for cracks and to see that they are clean, also pay special attention to the insulation on the HV in the power supply deck.

Check the cabling in the RF deck to be sure its not in the FSK mode, you'll need the manual for that.

Check the fuse size in the power supply deck. Fuses do get old and stressed, better spring for a few new ones.

Put new bearings in the fan motors. Its not too hard to do.

Check the condition of the Filament Voltage pot, this gets very hot, mine had a Chernobyl spot on it.

I had one relay that had one set of contacts welded shut, so you may want to check the function of all of them before you put power to it.

Not a bad idea to go through the manual and do the resistance checks at every tube socket and plug. This will give you a "baseline" for later troubleshooting, you'll know what it did when you got it, before the trouble showed up. This may also show problems if there are any.

Just my ideas,

Joe KG2CI

The spacers are available at most hardwares stores,
usually in the small drawers section.

The Plate Current meter not being recessed may be an
indication that the HV has been removed from the Tank
Coil, part of a common modification to produce better
audio. You can find this in the Files section of this
list. If that modification has been done there should
be an extra coil mounted on the RF deck near the
4-400.

Also, if that meter has been changed there should be
SIX mounting holes in the front panel. The phenolic
block should have mounting holes that do NOT match so
that the bolts can't go all the way through the meter,
the mounting block, and the front panel. The mounting
holes in the front panel SHOULD be at 10 O'clock, 2
O'clock and 6 O'clock. NOT at 12, 4, and 8 O'clock.

A Greenlee punch for 4" conduit will open up the fan
hole in the back panel so you can mount a nice, quiet,
muffin fan.

Joe

I may have missed that someone has already addressed this possible source of the HV problem in Todd's T-368, but check the HV feed-through ceramics throughout the chain.

These pylons are secured with cork washers to the copper-clad chassis. Over the years the cork compresses and may no longer allow enough give when the metal heats and contracts. This can cause the ceramic to crack, and you can get a zorch between the threaded shaft in the center and the chassis.

This can be a confounding problem because the zorch path is not seen until you unbolt each of the ceramic feed-throughs and have a look!

I found two that had some convincing evidence of arc action in my 1957 Crosley "C."

From: bearlabsusa
Topic: 2989  Message: 2989

Just a suggestion, perhaps schematics for the gear and related stuff that went with would be good to have posted up in the Database section??

I know you can download it from Bama, but on a dialup that is a lengthy process if all you want is the bloomin' schematics!

In fact I am downloading what may prove to be or not the BC-614 schematic/manual from Bama now, 8.4mb worth, which is about an hour or more on this stupid dial-up (can't get anything else out here!).

Just a thought.

I have a few parts from BC939 (?), BC610 (?), etc., which are surplus to my needs.

a) Roller inductor, labeled L5, has about 5 turns of #12 (?) wire on approx 2" diameter ceramic core. $15 + shipping

b) Amperex VC-50 fixed vacuum capacitor, approx 6.5" x 2.5". $20 + shipping

c) Jennings VC12-20 vacuum capacitor, approx 6.5" x 2.5". $20 + shipping

d) Switch assembly: this is part of a bandswitch (?) assembly , and has abpprox 4.5" shaft with spring mechanism and cloverleaf cam. No wafers or switch contacts. Free, if available, with other items.

e) Label plate, black, approx. 3.5" x 1", engraved with "Caution, before operation review TM-II-826 packd with equipment". Inlcudes screws & nuts. $5 + shipping.

Prices as listed, or $45 + shipping for the whole kit & kaboodle. (And where else can you get a kaboodle for so cheap?)

Please contact me off-list if you can use any of these.

Topic: 2976  Message: 2992

Todd,

The gray tuner is TN-339/GR. The BC-939-B is black, like the -A.

I've never had a T-368 in the flesh but if the mounting studs for the TN-339 are the same as those for the BC-939 on the BC-610, I have several sets of equivalent new parts. I bought the pieces from McMaster a year or so ago and because of the various minimum orders, ended up with enough pieces for three BC-610's plus everthing except the hex spacers for 4 or 5 more.

BTW, I never paid any attention but what was the original AC input connector on the T-368?

# 2993. Re: [T-368_BC-610] Power Connector and Other Info Requested

Yahoo group: T-368_BC-610
Date: 2007-08-23 19:09:36 UTC
From: wa5cab@cs.com
Topic: 2976  Message: 2993

OK. Then they aren't the same as those on the BC-610's where the 1/4-20 screw is 1-1/4" long and the threaded hex spacer is 1/2" long. So the new sets I have wouldn't work on a T-368.

In a message dated 8/23/2007 1:44:06 PM Central Daylight Time, chejmw@... writes:

Keith, ve3ts

# 2995. WTD: BC-610E RF Section

Yahoo group: T-368_BC-610
Date: 2007-09-04 18:35:58 UTC
From: Mr. David P. Goncalves
Topic: 2995  Message: 2995

Hello All,

Just got a BC-610E, with an RF section with many issues. I would like to make my job easier (already LOTS to work on just to light it up) by just replacing the RF section whole, and work on the old RF section (or part it out) after the main restoration.

I know that it is not very likely, but here it goes - is there anybody who has a junker that can spare the RF section, including the following:

Right Side Sheet Metal
Front Middle Sheet Metal
Intact coil socket
Fairly clean and intact TU plugin section

Will also consider units with most, but not all of the above. Perhaps we could swap RF sections with compensation? Not looking to buy an entire -610E.

Thanks all,

David Goncalves

From: g3vkm
Topic: 2997  Message: 2997

Hi All,

This is a "just for interest" question; I recently bought an HT-4 manual on ebay, it's entitled "Radio Transmitting Set Type EP 134" and covers the HT-4B TX, HT-5B speech amp and the AT-2 antenna tuning unit. Was the EP 134 an HT-4 for commercial or military use and what year (roughly) would it have been introduced? From the "typical packing list" in the manual it seems that the SX-28 and a Shure microphone were also part of the station. Any info appreciated.

73,

Roger/G3VKM - Norfolk, England.

From: K0DAN
Topic: 2999  Message: 2999

Apologies in advance if this is too far off topic, but it's close to right vintage...

CU-737/URC COUPLER-MONITOR (a.k.a. 180U2 TUNER/WATTMETER).

1KW wattmeter and tuner are mounted on a standard 19"rack panel. Wattmeter appears same/similar to the Collins 302C1 wattmeter, and also similar to the one built into the S-Line 312B-4 console. Wattmeter module has meter scale of 0-100 and 0-1000 watts, forward & reflected, and has a built-in 4" speaker with on/off switch. Tuner has a roller inductor with precision vernier, variable capacitor, and switch which adds fixed capacitors to the match. There is also a high/low impedance selector. The rear panel has a coupler for the SWR/wattmeter, which may be bypassed if desired. Unit has some scratches on the sides & top, but front panel is real clean. Photos available on request. $150 & pickup in Kansas City area or add freight to wherever you are.

Taking a poll.

What is a reasonable market value for a T-368, letter model, working and clean.

I'm not talking discounted "family price," nor a frenzied ebay price, but rather a figure someone just coming into the hobby, and not knowing anyone, might expect to pay to an individual, not a dealer.

Thanks

Paul

Late model, good condition...I'd expect to pay at least a kilobuck as an average price. Some go lower, some go higher, the better the condition and later the model, the chances it'll cost more.

Individual seller who isn't a dealer and just wants to get the rig into interested hands would be preferrable to convenience shopping on ebay, where high dollar is the rule rather than the exception.

Prices I've seen over the last few years Paul, range from Free to $3K. So $1K-$1.5K seems a reasonable expectation?

Well,
If you get one from a former MARS operator, it will come with, an MD-239, CV-116, The antenna coupler TN-339, and the T-368, and that whole package goes for around 1200.00!

Back when we were all looking for them just the transmitter, "status unknown" went for around 700 - 800. No spare tubes no any extras. Just the box and in most cases not even the AC cord and connector.

As a point of reference, in the early '90s, Fair Radio was selling ones that Uncle Sam had refurbed
and put into storage for, if memory serves me correctly, somewhere around $6-800 depending on which
variant of letter-sub-model.

Figure in finite supply and increased demand since then, and I'd agree with others here that $1-2k
is probably the going rate depending upon a variety of details.

# 3013. T-368 value

Yahoo group: T-368_BC-610
Date: 2007-10-27 16:03:25 UTC
From: Steve Hobensack
Topic: 3013  Message: 3013

Why does it have to be a letter model? I have the basic model, no letter (Barker/Williamson serial 75, 1953). The relays are open face, which means I can service them. The plate transformer has dual 120 volt primaries, which means I can modify for 240 volt input.

Why indeed...? The sealed relay driving the plate xformer in the later
models is underrated and especially failure prone. Lettered models regulate the
PTO tube heater voltage but I have found my Basic to be more frequency stable
than my C. Also, be aware that any T-368 one may find on the market today is
likely to be a hybrid. The power supplies are compatible across all models
as far as I can determine. Modulators are also interchangeable (except in
the case of the very late models) and a lot of drawer swapping apparently took
place at the depots.

# 3017. T-368 value

Yahoo group: T-368_BC-610
Date: 2007-10-28 16:47:51 UTC
From: VJB
Topic: 3013  Message: 3017

Thanks for the valuation responses.
As with R390A, the kind of life suffered by a given
example is probably more important to the value than
which model or contract it happens to be from.

That said, there are some points I'd consider, if by
good chance two transmitters presented themselves for
sale in about the same condition.

The plate transformer in the "basic" model power
supply has a dual primary 120/240 VAC that I always
wanted to acquire. All subsequent models were 120VAC
only, with peak current up around 20A, whee !

Also, there are a few incompatibilities when mixing
and matching drawers, as most on here already know.
There are two sets of voltages for the exciter relays,
depending on which model of transmitter.

I totally agree on the open frame relays and service
compared to the sealed relays.

However, I would prefer the ceramic/vacuum T/R relay
of the E/F over the open frame job of the earlier
models, believing it's less prone to arc damage.

I think the reasoning is, later model equals later components, lastest upgrades, and so on. Not unlike the companion R-390A receivers, the later EAC models being more sought after by many.

But the 'junkyard/depot dog' factor is the true issue. My D model has a later(?) silk screened power supply deck that doesn't match the other two original decks. Again, like the R-390A, tags guarantee nothing as far as some perceived pedigree.

Overall condition and utility is what's most important, but a clean, matching deck E or F would probably bring the higher price due to its 'new[er]ness'. Keep in mind that many folks looking today don't initially have an appreciation for nor knowledge of the differences. They just want a "T-3".

Tom -

The big blower in mine was removed when I got it, nowhere to be found.
Considering that the RF deck has a blower, and that the transmitter's
cooling requirements were based on a more continuous duty cycle, it makes
sense that the large blower wouldn't be needed unless you were going to run
TTY or some other key-down-intensive mode (like 20 minute AM old buzzard
transmissions).

Having a big muffin-type fan in the back would be a whole lot quieter
though, and certainly couldn't hurt.

The problem with the muffin fans is that they can't handle any back pressure like a blower. Back pressure is when they blow air into an enclusure which has restricted air flow due to blowing into a tube socket and intake/outflow through a filter and/or other restrictions.
I'd look into the specified airflow/backpressure into the 4-400 (I have Eimac datasheets on that and other transmitting tubes from my previous life as an RF design engineer - I designed high power tube and solid state amps) and at least double that for the enclosure.

hi just a note as an owner of two c models and one e
model ,i am not impressed by the vacuum relay mod they
made they, mgt`ed it to the top of the cabinet with
long app 10 " wire to the original ant box ,i found
this ry damaged and went to the mec relay in the box
configuration ,and have NOT had any trouble with any
of the t-3`s .they could have done better with the
mod.bro geo w8qbg.

you mgt a large rotron fan on the back door after the filter ,i did this to one of mine and get much more air flow comming out from the top back vent than before but with much less noise.oh i also opened up the intake hole on the inside of the panel for full fan air flow ,and added a two prong jones plug so i could remove the back out of the way w/o having to un screw any terminals.just a note bro geo w8qbg.ps i have two c`s and one e model.t-3`s.

George thanks for the user experience on the T/R
relay. I never had my hands on one, but have had to
clean the open frame T/R relay, and carve off a carbon
path on the bakelite from what appeared to be damage
from a nearby lightning strike.

Nice that I could actually GET to those surfaces to
clean and inspect, hi hi FB.

Paul/VJB

I was using my T368C the other morning on 160 meter and everything worked fine. the next morning I turned the T368C on and after 25 seconds or so I did not hear the relay kick in. Now I have no filiment voltage. I checked all the interlocks and there in good shape. I did notice that the blower for the 400 tube is not even runing. Any ideas on where to look would be appreciated. Gary

I have repaired similar units. All one needs is a light with a magnifier glass, and a VOM. By carefully probing of each turn, an open can be found. This resistance wire cannot be soldered but a twist splice will work if not in the path of the wiper. An Ebay favorite search under "rheostat" might get results but probably after months of waiting for a unit of the right size and resistance. I have thought of replacing that rheostat with a small variac because there is a lot of heat dissipated by the front panel.

# 3034. IARU bandplan and ARRL reax

Yahoo group: T-368_BC-610
Date: 2007-12-08 14:35:01 UTC
From: VJB
Topic: 3034  Message: 3034

Folks,

I know the T-368 list does not ordinarily carry material not directly related to transmitters, but there is a matter to be aware of as a user or appreciative fan of the T-3 and Beastie 610.

As you will read from the following article, the ARRL has signed an IARU bandplan that it has no intention of complying with, but which carries a risk of unwittingly portraying U.S. licensees as supporting specific bandwidths.

The designated bandwidth in the IARU Region 2 plan applied to North America is 2.7Kc.

Please consider contacting your ARRL representatives if your agreee this is a problem that they should immediately address. The goal is a voluntary plan we all can support, not the creation of a plan that we should ignore at our peril.

Thanks for considering. Full permission granted to further distribute to other reflectors and individuals who may be of like-mind. If you so, kindly include this little introduction, and change my sendout email to WA3VJB@... to indicate I am indeed a subscriber to the League.

Paul/VJB
~~~~~~~~
ARRL tries to calm bandplan controversy
from Paul Courson (WA3VJB) December 7, 2007

The ARRL, the club that has been allowed to represent all U.S. licensees at the International Amateur Radio Union (IARU), is trying to defend a new regional band plan taking effect in January that may not be supported by many American hams because of its bandwidth overlays.

A statement from the Newington-based group follows widespread concerns, letter-writing campaigns, and internet discussions that are critical of the details and the fact they were developed out-of-view of the licensees who ordinarily would support voluntary bandplanning.
~~~~~~~~

"During the conference, held September 10-14 in Brasilia, representatives from IARU Region 2 societies met in committees prior to a final plenary session and adopted recommendations," the League statement says.

The plan is the result of nearly two years of planning, according to an email from ARRL corporate executive Dave Sumner, K1ZZ. But that planning among Region 2 delegates has not been widely publicized for U.S. amateurs. Given the controversy over the concept of a bandwidth-based coordination scheme, the ARRL's endorsement of the plan has surprised many, including officials at the FCC when queries began to come in.

Many American hams are disappointed they may not be able to support the voluntary plan, and complained that the ARRL acted without their informed consent when it endorsed provisions that do not match U.S. operating patterns and could be used in future regulatory proposals.

In a website announcement nearly two months after the Brazil decision, the League downplays the lost support by emphasizing that U.S. amateurs need not comply with the measure which specifies a 2.7 kHz bandwidth for popular voice modes.

"There is also a mistaken assumption that the new IARU Region 2 band plan is an ARRL initiative seeking regulation by bandwidth. It is not, nor is it in any way a vehicle to achieve regulation by bandwidth," according to the unsigned ARRL message distributed in advance Dec. 7 to certain U.S. licensees who had written ARRL officials complaining they had no warning or opportunity to suggest alternatives.

The IARU concept of using bandwidth to coordinate modes and activities on HF is similar to the ARRL's failed petition last year to the FCC, which the group withdrew from the agency at a time of heavy opposition from both its subscribers and the greater amateur community in the U.S.

League officials, apparently misunderstanding the message from their constituents, continue to threaten to again submit such a petition in the future, when "some degree of consensus can be achieved in the amateur community," the new statement says.

Two sources within the IARU have confirmed that the suggestion of using bandwidth in the Region 2 scheme came directly from the League's Paul Rinaldo, 76, a paid staffer who has made it a mission to use the U.S.

regulatory system to force acceptance of digital communications, a category not popular in the Amateur Service.

The League attributes the enumerated bandwidth specifications to an IARU plan approved earlier for the European Region 1. But neither the ARRL nor key Region 1 officials explain why they prefer troublesome bandwidth parameters instead of the longstanding, accepted system of grouping modes by type to coordinate operating activities.

There is no technical discussion in the IARU plan that would help radio hobbyists determine whether they comply with the bandwidths specified. It was this same shortcoming as a factor that doomed the ARRL's Petition to the FCC, RM-11306, according to comments filed in the agency's public record.

League officials surrendered in that domestic arena before the FCC could act. Some critics believe the IARU step was an "end run" to an international venue where delegates may not have been aware of the extent of opposition to enumerated bandwidth among U.S. licensees.

U.S. League planners at the international venue have been mute as to why the IARU could not achieve a voluntary coordination scheme through generalized references to signal footprint, such as "wide," "medium," and "narrow," which would have been easier to grasp and implement.

"Many countries do not have government-regulated sub-bands within their amateur allocation," the League asserts in its December statement. But ARRL officials have not named a single country whose licensees would benefit from the new Region 2 plan using a bandwidth scheme.

Also of concern is the ARRL's reliance on specifications contained in documents of the International Telecommunications Union. The ITU takes suggestions from volunteer groups like the IARU, but does not typically initiate regulatory recommendations for radio hobbyists unless governments have expressed a clear trend the ITU may address.

One familiar example is the ITU's recognition of governments that discontinued the Morse code licensing element, which eventually led the FCC to also drop the requirement.

And despite the League's assertion it does not plan to use the new international plan as part of a new thrust for its agenda at the FCC, it's a different story on the IARU website. "It is suggested that Member Societies, in coordination with the authorities, incorporate it in their regulations and promote it widely with their amateur communities."

The League, charged with speaking at the IARU for all U.S. licensees, did not excuse itself from the call to promote the plan to the FCC and American hams. ARRL officials have not responded to questions whether they opposed enumerated bandwidths in IARU deliberations, based on a record of expressed opposition by their U.S. constituents.

ARRL President Joel Harrison, W5ZH, responding to emails in recent weeks from U.S. licensees concerned that they will not be able to support the IARU plan, said the ARRL's Board of Directors would have developed a policy for the League's representative(s) at September's IARU deliberations in Brazil.

But Harrison has not responded to requests to disclose that advance planning, confirm that it actually took place, and to somehow demonstrate that U.S. licensees were polled on the prospect of adding bandwidth overlays to the Region 2 plan.

The website statement says "ARRL has conducted an open process of soliciting input regarding matters of importance to the Amateur Radio Service. That will continue prior to the submission of any proposals for future regulatory changes to improve the Amateur Radio Service."

The apparent secrecy ahead of the IARU conference was the subject of an article in the December CQ Magazine. Editor Rich Moseson has been critical of the League's tendency to plan its policy and regulatory proposals without adequate input from U.S. licensees.

And now in the aftermath, with explanations that some deem incomplete and unsatisfactory from elected and paid ARRL officials, there are subscribers who insist they will not renew when their dues expire.

Steve Johnston, WD8DAS, wrote "I am a long-time member of the ARRL, and my respectful and gently-expressed opinions on the bandplan have been ignored, insulted, attacked, scorned, belittled, and pooh-poohed."

Particularly egregious was a patronizing email sent to a large group by the ARRL's George R. Isely, W9GIG, the elected Central Division Director. He was responding to concerns expressed by active U.S. licensees in their letters to him and other IARU and ARRL officials.

"The current mini-uproar is the result of a very few ignorant people with issues making postings to various un-moderated Internet email reflectors," Isley said in part. He later apologized to Johnston, but did not issue a revised notice to his constituents.

Harrison, the ARRL president, said "I don't believe good operating practice should be mandated by regulation." Harrison apparently disagrees with FCC ?97.101, which states in part "each amateur station must be operated in accordance with good engineering and good amateur practice."

Given his suggestion the U.S. can ignore the IARU plan, Harrison did not address why his club did not formally ask to be excused from the international body's call to now pitch the plan to U.S. and other regulators.

Among the hams confronting the ARRL for its role in the IARU plan, John Fitzsimmons, W3JN wrote "I think the suspicion is that once all of these bandplans line up, the goal of the ARRL is perhaps to lobby the ITU to institutionalize them at the next ITU WRC. Once so accepted by the US they would have the effect of being a treaty," he wrote.

Rinaldo met with ITU officials in late November about the planning process, according to IARU president Larry Price, who said no decisions were made at the meeting in Geneva.

# 3035. IARU bandplan and ARRL reaction / fix typos

Yahoo group: T-368_BC-610
Date: 2007-12-08 14:42:39 UTC
From: wa3vjb
Topic: 3032  Message: 3035

THIS ONE CORRECTS TYPOS

Folks,

I know the T-368 list does not ordinarily carry material not directly related to transmitters, but there is a matter to be aware of as a user or appreciative fan of the T-3 and Beastie 610.

As you will read from the following article, the ARRL has signed an IARU bandplan that it has no intention of complying with, but which carries a risk of unwittingly portraying U.S. licensees as supporting specific bandwidths to coordinate activities.

The designated bandwidth in the IARU Region 2 plan applied to North America is 2.7Kc, and AM is treated as a footnote not otherwise compliant with the scheme.

Please consider contacting your ARRL representatives if you agree this is a problem that they should immediately address. The goal is a voluntary plan we all can support, not the creation of a plan that we should ignore at our peril.

Thanks for considering. Full permission granted to further distribute to other reflectors and individuals who may be of like-mind. If you do so, kindly include this little introduction, and change my sendout email to WA3VJB@... to indicate I am indeed a subscriber to the League.

Paul/VJB
~~~~~~~~
ARRL tries to calm bandplan controversy
from Paul Courson (WA3VJB) December 7, 2007

The ARRL, the club that has been allowed to represent all U.S. licensees at the International Amateur Radio Union (IARU), is trying to defend a new regional band plan taking effect in January that may not be supported by many American hams because of its bandwidth overlays.

A statement from the Newington-based group follows widespread concerns, letter-writing campaigns, and internet discussions that are critical of the details
~~~~~~~~

and the fact they were developed out-of-view of the licensees who ordinarily would support voluntary bandplanning.

"During the conference, held September 10-14 in Brasilia, representatives from IARU Region 2 societies met in committees prior to a final plenary session and adopted recommendations," the League statement says.

The plan is the result of nearly two years of planning, according to an email from ARRL corporate executive Dave Sumner, K1ZZ. But that planning among Region 2 delegates has not been widely publicized for U.S. amateurs. Given the controversy over the concept of a bandwidth-based coordination scheme, the ARRL's endorsement of the plan has surprised many, including officials at the FCC when queries began to come in.

Many American hams are disappointed they may not be able to support the voluntary plan, and complained that the ARRL acted without their informed consent when it endorsed provisions that do not match U.S. operating patterns and could be used in future regulatory proposals.

In a website announcement nearly two months after the Brazil decision, the League downplays the lost support by emphasizing that U.S. amateurs need not comply with the measure which specifies a 2.7 kHz bandwidth for popular voice modes.

"There is also a mistaken assumption that the new IARU Region 2 band plan is an ARRL initiative seeking regulation by bandwidth. It is not, nor is it in any way a vehicle to achieve regulation by bandwidth," according to the unsigned ARRL message distributed in advance Dec. 7 to certain U.S. licensees who had written ARRL officials complaining they had no warning or opportunity to suggest alternatives.

The IARU concept of using bandwidth to coordinate modes and activities on HF is similar to the ARRL's failed petition last year to the FCC, which the group withdrew from the agency at a time of heavy opposition from both its subscribers and the greater amateur community in the U.S.

League officials, apparently misunderstanding the message from their constituents, continue to threaten to again submit such a petition in the future, when "some degree of consensus can be achieved in the amateur community," the new statement says.

Two sources within the IARU have confirmed that the suggestion of using bandwidth in the Region 2 scheme came directly from the League's Paul Rinaldo, 76, a paid staffer who has made it a mission to use the U.S. regulatory system to force acceptance of digital communications, a category not popular in the Amateur Service.

The League attributes the enumerated bandwidth specifications to an IARU plan approved earlier for the European Region 1. But neither the ARRL nor key Region 1 officials explain why they prefer troublesome bandwidth parameters instead of the longstanding, accepted system of grouping modes by type to coordinate operating activities.

There is no technical discussion in the IARU plan that would help radio hobbyists determine whether they comply with the bandwidths specified. It was this same shortcoming as a factor that doomed the ARRL's Petition to the FCC, RM-11306, according to comments filed in the agency's public record.

League officials surrendered in that domestic arena before the FCC could act. Some critics believe the IARU step was an "end run" to an international venue where delegates may not have been aware of the extent of opposition to enumerated bandwidth among U.S. licensees.

U.S. League planners at the international venue have been mute as to why the IARU could not achieve a voluntary coordination scheme through generalized references to signal footprint, such as "wide," "medium," and "narrow," which would have been easier to grasp and implement.

"Many countries do not have government-regulated sub-bands within their amateur allocation," the League asserts in its December statement. But ARRL officials have not named a single country whose licensees would benefit from the new Region 2 plan using a bandwidth scheme.

Also of concern is the ARRL's reliance on specifications contained in documents of the International Telecommunications Union. The ITU takes suggestions from volunteer groups like the IARU, but does not typically initiate regulatory recommendations for radio hobbyists unless governments have expressed a clear trend the ITU may address.

One familiar example is the ITU's recognition of governments that discontinued the Morse code licensing element, which eventually led the FCC to also drop the requirement.

And despite the League's assertion it does not plan to use the new international plan as part of a new thrust for its agenda at the FCC, it's a different story on the IARU website. "It is suggested that Member Societies, in coordination with the authorities, incorporate it in their regulations and promote it widely with their amateur communities."

The League, charged with speaking at the IARU for all U.S. licensees, did not excuse itself from the call to promote the plan to the FCC and American hams. ARRL officials have not responded to questions whether they opposed enumerated bandwidths in IARU deliberations, based on a record of expressed opposition by their U.S. constituents.

ARRL President Joel Harrison, W5ZH, responding to emails in recent weeks from U.S. licensees concerned that they will not be able to support the IARU plan, said the ARRL's Board of Directors would have developed a policy for the League's representative(s) at September's IARU deliberations in Brazil.

But Harrison has not responded to requests to disclose that advance planning, confirm that it actually took place, and to somehow demonstrate that U.S. licensees were polled on the prospect of adding bandwidth overlays to the Region 2 plan.

The website statement says "ARRL has conducted an open process of soliciting input regarding matters of importance to the Amateur Radio Service. That will continue prior to the submission of any proposals for future regulatory changes to improve the Amateur Radio Service."

The apparent secrecy ahead of the IARU conference was the subject of an article in the December CQ Magazine. Editor Rich Moseson has been critical of the League's tendency to plan its policy and regulatory proposals without adequate input from U.S. licensees.

And now in the aftermath, with explanations that some deem incomplete and unsatisfactory from elected and paid ARRL officials, there are subscribers who insist they will not renew when their dues expire.

Steve Johnston, WD8DAS, wrote "I am a long-time member of the ARRL, and my respectful and gently-expressed opinions on the bandplan have been ignored, insulted, attacked, scorned, belittled, and pooh-poohed."

Particularly egregious was a patronizing email sent to a large group by the ARRL's George R. Isely, W9GIG, the elected Central Division Director. He was responding to concerns expressed by active U.S. licensees in their letters to him and other IARU and ARRL officials.

"The current mini-uproar is the result of a very few ignorant people with issues making postings to various un-moderated Internet email reflectors," Isley said in part. He later apologized to Johnston, but did not issue a revised notice to his constituents.

Harrison, the ARRL president, said "I don't believe good operating practice should be mandated by regulation." Harrison apparently disagrees with FCC §97.101, which states in part "each amateur station must be operated in accordance with good engineering and good amateur practice."

Given his suggestion the U.S. can ignore the IARU plan, Harrison did not address why his club did not formally ask to be excused from the international body's call to now pitch the plan to U.S. and other regulators.

Among the hams confronting the ARRL for its role in the IARU plan, John Fitzsimmons, W3JN wrote "I think the suspicion is that once all of these bandplans line up, the goal of the ARRL is perhaps to lobby the ITU to institutionalize them at the next ITU WRC. Once so accepted by the US they would have the effect of being a treaty," he wrote.

Rinaldo met with ITU officials in late November about the planning process, according to IARU president Larry Price, who said no decisions were made at the meeting in Geneva.

# 3036. Help with BC610 high B+ voltage connection to RF deck

Yahoo group: T-368_BC-610
Date: 2007-12-13 18:07:29 UTC
From: Steve
Topic: 3036  Message: 3036

Some time ago, I was able to acquire a BC610. Although the exciter section works well, I am not able to get high B+ to the final 250TH. The switching circuitry (RY1, line AC voltage on primary of plate transformer) seems to work. However, there is no continuity between the plate current meter M2 and the final plate cap.

Probably, I did not properly hook up the high B+ from the modulator section to the RF section, and the manual and wiring diagrams are vague about this. Can someone tell me exactly how to hook up the high voltage to the RF section? i.e. from where on the modulator board (RY3?) to where on the RF section?

Many thanks and 73
Steve WA2DTW

Steve,

The "specific" Model of BC-610 will VERY likely have a bearing on how
the HV is run.

In my BC-610(I), it comes through the Mod deck through a porcelain
insulator and goes from there to the + side of the plate current meter.

Steve,

1. Which model of the BC-610 do you have?

2. Are you working off a schematic or one of the so called "practical"
wiring diagrams?

What model is it and can you take a picture of the RF deck as it stands now?
If not a better description of what is there would help. Having said that, note:
The HV comes from the modulator deck in all models, that is number 1.
next was the plate meter if an h or later replaced, and if so is it still insulated
from the chassis. Most likely not as you would have a more "glowing" description
of your problem. The HV goes to the HV RFC and the bypass cap mounted close to
the exciter deck. From there it goes to the plate coil socket (X2) wires from the coil
socket it goes to the Plate cap, the end of the plate cap nearest the 250TH has a lead
going to the tube.

Descriptions man, "I need descriptions, I'm old and suffer from "CRS", Hi, What does
the HV measure at the Modulator deck relay?

Steve,

PAY STRICT to JIM, WB2FCN !!

He restored MY BC-610(I).

He knows the VERY WELL.

I "too" suffer from CRS (Can't Remember Squat!). I ALWAYS go back to
the manual.

# 3042. External VFO for the BC-610?

Yahoo group: T-368_BC-610
Date: 2007-12-20 15:30:12 UTC
From: g3vkm
Topic: 3042  Message: 3042

Hi All,

Does anyone have any tips on using an external VFO with the BC-610,
mainly for CW operation? I have a pair of good Heathkit HG-10Bs here
and would like to use one on 80 and 40 metres, using a standalone PSU.
Have a feeling there was something in Electric Radio magazine about
this topic a while ago, (by N6PY?) but can't lay my hands on it right now.

73 for 2008,

Roger/G3VKM

# 3043. RE: [T-368_BC-610] External VFO for the BC-610?

Yahoo group: T-368_BC-610

While I cannot speak for the BC-610, it being some thirty-five plus years since I owned one, I do use the Argonaut V with an attenuator with the T-368 as an external VFO. TCXO is a plus. The PTT output is really the Argonaut V input which has a very low current switch to zero when keyed and I use a DFET to drive a relay for switch over.

I drive the T-368 with about .125-.25 watts. Of course, unless you happen to have an Argonaut V, this is not a cheap way to drive the big iron.

But, never any doubt about where I am. Plugs right into the T-368 VFO deck from the front panel. I use the 50 ohm input and not the 1000 ohm input to the exciter.

Hi Roger..

I just feed the VFO output into one of the crystal sockets on a tuning unit.
I have an old crystal I gutted and use as the plug. No problems with a
Johnson vfo and I'm sure the Heath would work equally well.

Merry Christmas..

hi rogeri have 5 b-c810`s ,i use heath vf1&`meisner
sig shifters and on 20m i use a t-368 vfo because of
the low drift.they all work great the shifters drive
the807`s the others go to the xtal socket.im using
lower b+ and a 6au5 to lower the drive to the 6v6 in
the 610 gud luck

I built a small supply for a Collins T-195 PTO and feed the output of
that right into the crystal socket of the TU. The plug is a crystal
holder with the crystal removed and the PTO lead soldered to the pins.
Plenty of drive and rock stable.

Good luck, Merry Christmas and happy new year,

Tom N5AMA

Try joining the T-368-BC-610 group.

<T-368_BC-610@yahoogroups.com>

Personally I have two of them, formerly I was HL9GN.

My memories of 'HL1' would seem to indicate Korean Intel/Security.

Date: 2008-01-19 02:12:49 UTC
From: John King
Topic: 1270  Message: 3056

Go for it!!! It is a heck of a mobile rig!!!!

My BC 610 E is 30 inches WIDE plus about 1 inch extra
width for the platform.
DEPTH of the BC 610 E is 18 inches plus 6 more inches
for the platform depth.
HEIGHT is 41 inches tall from the floor including
platform and casters. Without casters, would be about
37 inches tall.

I helped load a BC 610 E in the back door of a Ford
Expedition about two years ago. We lifted the 400
pound monster up on a hydraulic lift bought from
Harbor freight and slid it into the Expedition ON IT'S
BACK. The rear seats in the Expedition were removed.

Mine is on a platform with large casters so that is
something to consider. Does the subject BC 610 sit on
a platform with casters? Let me know if I can be of
further assistance. 73, John, K5PGW

Jim- I don't have a beastly 610 (I'm a T-3 owner) but
according to the following, the Hallicrafters HT-4,
the civilian rig that the BC-610 was derived from,
had dimensions of 29 inches wide x 19 inches deep x
37 inches high:

http://home.c2i.net/la5ki/200303/photo/ht4.jpg

73 & good luck (my T-368-E made my then-F250SD ride
nice and soft on the trip home)

take it apart in two sections. Top section is rf deck, leaving mod deck and power supply deck. power supply deck has about eight screws and drops from the mod deck. Put the RF deck towards the front of the vehicle, the power supply in the middle, across the axles so it doesn't through the handling off. and the mod deck in the rear, drive away, hope you have minimum people traveling with you. It works for moving the thing if you don't have a van, and movers.

Hi Alan,

That's a long shot! I've looked for one in vain and finally decided to build an equivalent using a pair of 500pf variable caps (50 quid off eBay) plus a pair of roller coasters of about 30uH connected to turn in sequence, again I got the roller coasters off eBay. Whole thing is mounted on an open-frame 19" chassis. It tunes my doublet fine on 80 metres. Can send you some photos if required.

73,

Roger/G3VKM

Hi Alan,

Well it's just two Pi-tank circuits, one in each leg of the feeders, so nothing complicated. I have a 4 amp RF ammeter in one leg of the feeder and tune up for max smoke/280ma dipped on the PA current. You don't need roller coasters either if you can lay you hands on some coil stock. The Johnson 1kW 250-30 would probably do the job but do you want to pay that sort of price?

Sorry to hear you haven't found the typewriter yet; assume you've tried collectors groups for that, sure there must be people who collect them?

Had a 3575kc CW QSO with Wim, PA0CMP, yesterday on the BC-610 here and WS12/R107 at his end, much chirping from me using the MO, so I must get a crystal for that frequency! Have you been chasing the AM DX on 3705kc? I understand Max has been working the States around 0500GMT with the Dutch guys.

Let me know if you want more info on my lash-up tuner. Keep warm, we might be getting some white stuff this weekend, the WX man says!

hello roger. well, thanks. there are actually some good designs in the old arrl handbooks i have. throuble is i will never get round to it ! my son is expecting a new addition to his family any minute, and i spend a lot of time with the little one. i really have to work at it to get some radio time !
i am afraid that it is all too early for me on the dx front. i always get up before 6, from my long years of getting airborne early, but sit around having tea end breakfast.
i really should get round to it. with max's bc 610, yours and mine, we will have to form a group. it was his suggestion about the johnson kw tuner. he says they are not too expensive. i now have the collins 618t all ready to go except for the 115v 400hz inverter which i am waiting for. i sold my drake, and am using most of the money to get a telefunken e 1500 from helmut singer in germany. that will work with the 618t, as it only tunes in 1khz steps, and you want a tunable rx to go with it. cheers, alan

From: John King
Topic: 3073  Message: 3073

I would like to have a discussion about the variable oscillator for the T-368, with someone. Would someone knowledgable about the T-368 and the (VFO) master oscillator please email me directly. Thanks and 73,
John, K5PGW

Keith- put on your Nomex garb for those who may flame you for uttering SSB and the AM-er's beloved T-3s in the same sentence....

More seriously, I recall that there was some military or MARS variant (sounded much more like an irreversible butchering) of some T-3s to make them into linear amps. But again, it was apparently drastic, and not something you'd want to emulate now that T-3s are cherished items rightfully deserving preservation.

You'd _definitely_ need to change the bias, as the T-3 runs the final in Class C for max. efficiency in its as-designed mode-- but that'd be very non-linear and cause hideous distortion and splatter as an attempted-linear amp of SSB.

The final is grid-driven, so you wouldn't need much power at all- far, far less than the typical grounded-grid ham linear.

Some of the older ARRL handbooks list data for the 4-400 in grid-driven linear mode )as contrasted with strapping the grid and screen together to make a pretend-triode for grounded grid, a technique also popular with hams, but too major a hack of a T-3), and you could probably get a sense from that data what drive, bias, plate, and screen voltages you'd need.

My instinct is that it'd make more sense to find or build a separate linear

Amen! Just don't use a Globe King 500 either, someone did that to the
one I've got. Evidently the big HV transformer failed, so he yanked the
one off the modulator deck and cobbled it onto the power supply deck and
ran it as a sideband linear. I'm still un-doing weird little changes
and replacing missing parts.

As others have said, Keith - it makes a really nice AM rig. The
military did have a version for SSB, the T-946. It's considerably
different than the T-3. Provided it's not a real dog, you could likely
sell the T-368 for enough to buy a T-946 and have money left over.
Finding one would be the fun part.

~ Todd, KA1KAQ

Keith,

WHY??? Why butcher up a really fine AM rig? May you have more than you need and can spare one. At many of the local hamvest I see many amps in the 250 to 300 dollar price range, that would probbly put out more power than the converted T 368. In fact, I have an unused Heathkit SB200, much smaller, desktop, lighter, and would fill your bill if you have an extra T368 that you may want to trade. Ha Ha

Does it settle down after an hour or so?

I seem to remember that the VFO stays powered when the T3 is shut down but left plugged to power. Upon cold start after all power has been removed, there will be a warmup period as the VFO comes back to stability - does it ever become stable?

Yes it works well. It works by putting the ssb excitation into the external exciter input connector on the front of the rf deck. It only takes a watt or two. I use my Central Electronics 10B exciter which is already low power, but I have a 5 watt 50 ohm carbon resistor across the input for swamping. Also there is special coax between the back of the input connector to the side of the vfo sub deck. This threw me for a loop when troubleshooting one time. The special coax has high resistance and failed to properly terminate the output of the Central Electronics 10B exciter. I finally dismantled the set-up as it was a mess of haywired muting lines , keying lines, coax jumpers and an external t/r switch. After all, I have another ssb rig and amp that is easier to use. hi.

Topic: 3076  Message: 3089

*Gents,

For operating parameters for 4-400s...the E.F. Johnson "Thunderbolt"
linear is a typical example of grid driven linear for SSB service.

It uses a pair...and is grid driven...

No need to re-invent the wheel...it was a common technique in the low
power ssb exciter days...another example is the Heatkit "Chipppewa"
...also uses a pair of grid driven 4-400s...

Electric Radio Mag. has covered both of the these linears in detail...in
months past...

I just remembered, the Johnson Viking 500 runs a 4-250 but most users have upgraded to a 4-400. That transmitter was also designed to be an ssb linear amp. There is an so-235 on the chassis for an external exciter input.
The mode switch on the front panel has an ssb position. When activated, a string of VR tubes engage. Doesn't the T-3 have a string of VR tubes for this purpose? Find a schematic of a Johnson Viking 500 and use it as a guide.

Very Interesting .... by theory the class C amp should distort SSB badly. Hmmm. Did you change any bias settings?
Thanks for the note, when I get moved I'll give it a try...

Yes it works well. It works by putting the ssb excitation into the external exciter input connector on the front of the rf deck. It only takes a watt or two. I use my Central Electronics 10B exciter which is already low power, but I have a 5 watt 50 ohm carbon resistor across the input for swamping. Also there is special coax between the back of the input connector to the side of the vfo sub deck. This threw me for a loop when troubleshooting one time. The special coax has high resistance and failed to properly terminate the output of the Central Electronics 10B exciter. I finally dismantled the set-up as it was a mess of haywired muting lines , keying lines, coax jumpers and an external t/r switch. After all, I have another ssb rig and amp that is easier to use. hi.

Ah,
As a point of clarification, The exciter input connector if not modified in some fashion, goes to the 6000 tube directly. This tube is operated class "C", I don't see how you could get ssb output from the T-368 without seriously modifying the 6000 stage, and the 4-400A PA stage drasticly. There appears to be a bit of confusion here.

If you drive the T-368 in its normal configuration, through the FSK exciter connector what you first do to the signal is match to the 6000, at the proper level, then shift the frequency the proper amount to generate FSK. This was done in conjunction with the MD-239 FSK modulator. Note here gang this is frequency modulation, and if you pump SSB into the rig in FSK mode the thing WILL cause serious distortion of whatever signal audio-wise you are using to drive the stage.

As always YMMV, Need to check the manual, before attempting to modify the thing. Nuff said.

# 3094. For Sale: T-368E Transmitter

Yahoo group: T-368_BC-610
Date: 2008-02-20 16:48:21 UTC
From: Bruce
Topic: 3094  Message: 3094

My interests have changed to more early gear from the 1920-30s, so I wish to pass this fine transmitter to someone.
I must share that I find it somewhat hard to give this up, as it is my first T-3, the one that
started it all for me.
I've have had two since, including one which I fully restored, but held onto this one.

The unit is very nice condition, a solid 9.5 out of a 10, folks that know me can vouch the manner in which I care for my gear.
The modifications are few, and include a professionally built N9FOY speech amp, a neatly installed variac on the rear panel to control blower speed, and a backlit exciter dial. I have
a spare stock speech amp, should you wish to revert to the original, which will be included in the deal. I also have the factory manual, and much documentation, but that is currently in storage in Buffalo, NY, so you'll need to wait a bit for that.

This is a later "E" model with vacuum sealed relays, and the unit has performed flawlessly since I've owned it.
First acquired in 1998, it is currently ready to go on air, plug and play as the computer folks like to say.

Most of the Buffalo AM contingent can vouch for this unit, it has been used at special event stations in the Buffalo area back in the late 90's and early part of 2000. You may have also seen my T-368 info page, it can supply more information about this transmitter series. Please reference my website at www.w1ujr.net/t368.htm

The price is firm at $2950, and the transmitter is currently located in coastal Maine, where
I can demonstrate it to any interested parties.
I've mixed feeling about selling this, so understandably I'd really like to see it end up with
someone familiar with the operation of vintage gear.
As this is a sale listing rather than a discussion topic, I've locked this post, so please feel
free to email me directly.

Tnx!

73 Bruce W1UJR
www.w1ujr.net

PS - I've also some other gear; National HRO, NC-300, National SW-3, 1-10s, WRL Globe Scout, B&W 5100 w/ SSB adapt, Hammarlund HQ-180, HQ-170, numerous Collins 32V series, Collins 310B exciter, Heathkit DX-100, Johnson Ranger, etc. Should interest merit, I will list here before eBay. I don't have a complete list developed yet, but you may contact
me directly about that gear as well. And if you have a mint Grebe CR-18, we can talk

trade! Tnx agn - Bruce

From: Mark Foltarz
Topic: 3096  Message: 3096

Group,

I am attempting to fix an oil leak on the plate supply transformer in my T3.

The oil is seeping past one of the HV side insulators.

Of course it does not leak if the transformer if upside down ( terminals up ), however, it won't fit in the cabinet that way.

So, anyone else tackle this problem before ?

tnx

From: James M. Walker
Topic: 3096  Message: 3097

Yep,
first remove the transformer from the unit. (I know)
then with the transformer "sitting on its' top (away from the terminals),
you will need a variable speed drill, and a "fluid plug assy" . Drill the proper
size hole for your assy. drain the remaining oil from the transformer, discard
properly.

With the oil removed, find the leak near the terminals, sand an area a little
larger than the hole, apply a piece of copper flashing to the hole, and solder in
place, (the case is steel and MUST be clean before the solder will hold. Once
that is done, invert the transformer, pick a side, preferably the rear-ward side for
easy access, drill a hole again in the case, this is for the the fluid plug Assy.

If you drill the hole carefully, there will be just enough clearance in the hole to
"thread" the fluid plug assy in and tighten it, "Don't forget the gasket" it comes
with the assy. Tighten it down, lay the transformer on its side with the plug assy.
facing up, refill the transformer with "transformer oil", insert the plug portion.

Return the transformer to the T-368 cabinet/chassis. Bring the transformer up
alone with a variac and let it sit idle to warm up a bit. then you are done, if you
don't see any leaks.

FWIW, and as always, should you be caught with illegal transformer oil,
the president will disavow any knowledge of your actions. "Good luck" Jim!

Mark,
I did this on a different piece of gear but it may work. Get a piece of rubber fuel line and a small automotive hose clamp. You take the wires off the terminal, slide a small ring of fuel hose over it positioned over the leaking ceramic-metal seam. Slide the hose clamp over the rubber ring and snug it up. dress the thing up to keep your clearances and gently cut the "tail" off the hose clamp. (You can skip cutting it if you have enough clearance.) Then carefully put your wires back on the terminal.

Just a word of caution make sure the hose is NOT reinforced with steel mesh! Otherwise, this worked very well on the modulation transformer of a 500W MF A1/A2 marine radio telegraph transmitter and the repair lasted for at least 10 years. The B+ was 2200V A1 and 1800V A2. I'd definitely put an undersized fuse in when testing this. If you do it right, it should work fine , but with all jury rig repairs , there is some "RISK".

From: Joe Foley
Topic: 3096  Message: 3099

Do NOT solder on the HV terminals, that may make the leak worse, it may also make the other terminals leak. There's really no need to do that anyway unless your HV wiring is bad, leaking. Even then you could cut the wires off away from the HV terminals and re-connect there keeping the heat away from the terminals.

Instead, turn the power supply deck upside down, much easier to work with. Next, clean the terminals with alcohol, clean well, trying to get the alcohol into the place where the leak is. If you're satisfied that you may have all the oil cleaned out of the joint then use very thin super glue applied into the joint, that will do the trick. It may be hard to find "very thin" super glue but that is the only kind that will do what needs to be done here.

You're trying to use capillary action to draw the glue into the joint before it hardens. This is a technique I've seen used on plexiglas where the two pieces are clamped together and the glue run down the edge of the two pieces, it is sucked into the joint and becomes invisible!

Golly, how time flies! This has worked on my HV transformer for almost 10 years!! Well, Ok, maybe only 8 years. Check the archive for this list,... it's in there somewhere.

I wouldn't worry too much about the transformers, they normally would use the listed, open frame, ones that are original to this one. Overhaul usually means that they checked everything for specs and replaced and adjusted as necessary and probably new tubes as well. I would guess the overhaul was done in the early 1950s when all the E model parts were still the majority.

That's a decent price but it probably means a road trip to pick it up. That seems to be the second one in the last six months to have come out of a sale at the Anniston, Alabama army base.

There is a speech amp for the BC-610 (and E model as well) for sale here...

http://cgi.ebay.com/BC-614-E-Speech-Amplifier_W0QQitemZ280205413682QQihZ018QQcategoryZ4675QQssPageNameZWDVWQQrdZ1QQcmdZViewItem

It looks a bit scruffy but seems to have been partially re capped at least.

Forwarded from the milsurplus list:

I have ( FS ) (3) HV Transformers for the T-368. I purchased these from Fair Radio several years ago with the thought of having a large amp made. I have other priorities now and the amp will not be in the mix. I thought I had (4) transformers, but can not seem to locate it. If I find it that will also be ( FS ). I would like to sell all units as one lot. Phil at Fair Radio tested these before I purchased them and gave the thumbs up on them. Thats all I can say about them. They are still in there shipping boxes. I never opened them. Pick up only is the name of the game here. I will NOT in any way move these units from where they are stored. They were stored here in the garage ( Dry Location ) and climate controlled. If interested drop me an e-mail.

From: M0GHQ
Topic: 3109  Message: 3109

I am needing a right hand side panel for my BC-610E model, the side with the card pocket. it must be original wrinkle paint and with the 'SC' mark or the triangle intact. failing that, might someone send me a picture of the 'SC' mark used on the E model so I can restore this one to original.
I also wish to use this one into a doublet, according to the handbook there is a coil option to use this with a doublet, does anyone have one of these that I might buy or any details of running the '610 into a doublet, sadly my available space is not enough to have a resonant antenna so the option of running the doublet directly from the ant terminals is not available. 73 Max

Hello Max,

What bands are you intending to use the doublet on? I think the coil option you refer to is the swinging-link PA coils, if so I may be able to help, for some bands, as I have a lot of duplicate coils, especially the higher bands.

Probably not a good idea to use the antenna straight into the output link, as there will be little attenuation of harmonics. I've built a copy of the AT-2 but using roller-coasters instead of the tapped inductors; it loads my much-bent 130ft doublet up well on 160 and 80m.

Couple of things... (late to the party here...) I kinda like the crazy glue idea, but I doubt that alcohol is a useful solvent for transformer oil, it may be, but I doubt it. Think that it is likely that acetone and/or MEK will do the trick? (available from your local beauty supply shop in a pinch!)

Depending on where the leak is, you might want to try the crazy glue AND something known as "Flowable Silicone Rubber" - it is sold in auto supply houses for windshield repairs. Flows nicely. Seals, impervious to oil after it sets, but you need scrupulously clean surfaces.

Wonder exactly where the leak is?
Between the ceramic insulators and the case?

Mark,

In earlier T-368 models the PTO runs continuously. The switch in the "F" model provides the option of letting it run continuously or only when the rig is keyed. My "C" (BTW) has what appears to be a field mod which keys the PTO along with the rest of the transmitter (always, no switch).

The PTO is well shielded so running continuously usually causes no interference on receive. However, a couple of exceptions to this have been reported on this forum.

Regarding the lack of drive on my model F T-368....

Heh, nowhere have I found any mention of moving around the BNC connectors to 'patch' in the VFO to the buffer / multiplier.

But that is what was holding up the show. I am guessing that this was the loop for the FSK modulator.

So when I connected the PTO to J101 it came to life.

A few more tests and should be on the air.

# 3126. BC-610-E CW key up voltage

Yahoo group: T-368_BC-610
Date: 2008-04-29 22:20:38 UTC
From: ve3iku
Topic: 3126  Message: 3126

I am restoring a BC-610-E. So far, I have the power supply chassis working. With 120VAC on the "2500V" tap, I measure 3400 V with just the bleeder resistor as a load...with a 12.5K resistor load, I measure 2650V which is more in line with the intended voltage. The 75K bleeder simply does not draw enough current for critical inductance (11H) to be a true choke input, so the voltage soars. Question: In CW, with the key up, there is no load on the power supply! So I would expect the voltage to swing from 2600V to over 3400V! Is this not way over the safe limit for 866A's? How does one operate CW then? On AM there is the modulator and RF deck heavy loads present all the time, so there is no problem.

73,
Boris

# 3127. Re: [T-368_BC-610] BC-610-E CW key up voltage

Yahoo group: T-368_BC-610

From: rbethman
Topic: 3126  Message: 3127

Boris,

They made a change in the BC-610(X) series. In lieu of 866s, they went to 3B28s, a change in the gas used inside. I do NOT know if it was for the reason you are seeing, but I have NO stress on the 3B28s at all.

One of my two is a BC-610(I), the other one was redone by Depot in 1959, and has a new data plate referring to the radio as a T-213.

I guess I'm going to have to take the T-213 data plate off - IF for no other reason than to find out what the data plate that is UNDERNEATH it reads. Depot simply put the T-213 plate OVER the original.

Hi Boris,
for whatever it is worth:
in the early 60's in the army my job was installing, and repairing BC-610's(I) & T-368'S thru the e model.I have a 610I at the house now.
we had 2 610 I's that operated cw 24/7, and keyed every 30sec. as channel markers. from time to time one of the 3b28's would go triping the overload relay.
we replaced the 3b28's with 866's and never had a failure in the 4 years I was there.
this was in germany, and we used a xformer 220 to 115v 50 hz to power the 610's.
to my knowledge the 3b28 is a xenon filled tube-less noise tham the 866.
my 610 I has 2700vdc using 3b28 at 120 v in. might be a good idea to use a step down xformer or Variac and operate at 115v.

best regards,
chuck strozier

Also, the numbers I quoted are Frank. Amphenol also made similar connectors
but in general their part numbers make less sense and I've never actually come
across a 9-pin male from them. If they made it, it might have a number like
164-44MS-625. That's a guess based on the number for the R-392 female
connector.

Topic: 3126  Message: 3130

Boris,

I don't know the answer to your question. I haven't worked on any BC-610's since the 70's and memory grows dim. But that does sound excessive.

The change to 3B28's was made primarily because of problems when operating under arctic conditions. The warm-up period before you could operate the transmitter was excessive and if you cheated you'd arc over the 866's.

Bob, if your T-213/GRC-26 has cylindrical transformers (except for the plate transformer) it was a BC-610-F. If they are all rectangular with slightly rounded corners it was a -G, -H or -I. But you'll have to pull the nameplate to find out. However, unless you are just curious it doesn't really matter. I once owned three T-213's that were still in the crates when I got them. The only differences I ever noticed between the three was that one had been an -F.

There are several that will work. I think most commonly it was UW1320MB17. UW1220MB17 may have been supplied with some models. And depending upon what cable diameter you have, you might need 15 or 21 in place of 17 (the figures are the nominal cable gland or clamp diameter in 32nd's of an inch). Further, M means Male, B is the 9-contact insert, 1220 is dogbone style body (takes a special pin spanner to assemble) and 1320 is commonly referred to as cathredral style (assembly tool is a screwdriver).

From: g3vkm
Topic: 3133  Message: 3133

Hi All,

The BC-614-E speech amplifier for my BC-610-E has given up the ghost.
Looks like the output transformer, T-102, has an open circuit primary
winding to bot anodes of the 6SN7 output tube. Anyone have a scrap
'614 with one of these transformers in? Its made by the General
Transformer Co, their P/No is 55A022 and the Signal Corps P/No is G26257.

# 3134. Smoked and baked BC610 filament transformer

Yahoo group: T-368_BC-610
Date: 2008-05-23 14:59:39 UTC
From: Steve
Topic: 3134  Message: 3134

Was having an enjoyable QSO on 160, getting good modulation reports etc. At the end of a transmission, the faint smell of smoke and a sizzling sound. Turned off the power immediately, then thick black smoke started billowing out of the power supply section. When the smoke subsided, opened the back cover. The potted transformer T2 (rectifier filament transformer) was hot to the touch and the potting had fresh hot tar on it. (Also, the coil of the Dow Key antenna relay, which I powered from RY4, the antenna shorting relay supply, was hot to the touch).

Took a full week to air out the room.

Removed the rectifier tubes (3B28's) and turned on the filament switch, and the fuse T4 blew.

Has anyone experienced this? Is a burnt out T2 a common occurrence? Likely causes?

I hope to get this BC610 (H model I think) back on the air soon. Any suggestions would be most appreciated.

Many thanks and 73
Steve WA2DTW

Steve this is NOT a common occurrence that I know of at all. At least
over 7 years of having and using these Beasts.

You should be able to find another xfmr OR have it rewound.

hi steve i keep 5 bc610`s running and 3 t3`s, i had
the same thing happen to me some years ago on a
bc610/i model.i believe the primary had shorted turns
.my repair was to disconnect the xformer from the
circuit completely. then i simply plugged in a pair of
solid state rects into the sockets,and away it went .i
left the old xformer in place and added a note by the
rect tubes saying to only use solid state rects as
replacements this box has been running happy for abt 6
yrs this way and i consider it an advanced fix. its a
whole lot cheaper than having the xformer rewound and
everything looks the same. 73`s for now i hope i have
been of some help.bro geo w8qbg.te replacements and
that the xformer was defective.

Which BC-610 is it first of all and second is it stock? Another question comes to
mind here as well, you mentioned you are using the antenna shorting relay supply
voltage to operate the dow key, is that correct. As in when in transmit the antenna relay removes the short to the antenna terminals. Current draw is a question. Dow keys don't really use a lot unless you are doing something fancy with them.

Oh yeah on 160 meters, what are you using for antenna "system" description please.

From: Steve Hobensack
Topic: 3138  Message: 3138

My T-368 used to use 3B28's. I use a pair of those solid state rectifiers that look like a metal 6L6 with a plate cap. The rectifier filament transformer is now redundant. I don't remember the nomenclature of the solid state rectifiers, but they are a fairly common thing at hamfests. They twist right in without mods.

NOT True! Actually, due to the design layout, the problem he seems to be having DOES require the filament transformer to be present, unless a connection is made from the 2N2367 socket to the input of the HV choke. If he just pops the rectifiers in and it turns out that there is an open in the lead
that goes to the choke (physically) there will be NO high voltage output.

Lets first look at the schematic before declaring that it just takes a device
change as in from 866/3B28 to the 2N2367s to "keep on trucking". It really does matter if the filament transformer is open, as you would need to make certain the HV circuit is complete.

As always your mileage may vary. FWIW

Folks are missing the REAL point!

It is NOT that the solid state replacements "require" a filament voltage.

What WB2FCN is EXPLAINING, is that there is a REQUIRED continuity in the circuitry. THEREFORE, if there is no continuity THROUGH the filament transformer, you WILL have issues with the HV.

Warren,

160 mtr PA coils ARE out there. If not located, they can be made. There USED to be a website where someone had made a 160 mtr PA coil by applying windings on PVC. I can't find that information at the moment.

That's why I included WB2FCN in the addresses. He's the "miracle worker" on these "Beasts".

There are three pages in the TM regarding modification for 160 meter use. Once so modified, IT MUST BE UN-DONE FOR USE ON ANOTHER BAND!

For 160 meters, use a 2.0 - 2.5 type tuning unit. To lower the frequency of the tuning units hang a 100pf cap across each of the variable caps in the unit. Be VERY careful when you set the frequency! You can get DOWN to a bit above 1600KC!

Rodger,

Thanks!

Warren isn't on the group YET. I forwarded the link AND the suggestion
to join the group.

Roger, Bob and the gang... I'm on the group, just old fashioned, I
don't usually reply to all
73, and hope to hear some AMers down here in Florida Sunday morning on
the FL AM GROUP
3675 7am...
Thanks for all the help and the link to the 160m coil...
I'm listening on 7290 now (1600z)...but may be a bit early for farty...

AM!!

Warren,

You mentioned that you had the Hallicrafters manual for it.

Keep in mind that the HT-4 was advertised AND sold to go on 10 meters.

Uncle Sam INTENTIONALLY dropped that. These "animals" CAN do so with reworking of a TU AND winding your own PA coil - HOWEVER - they get a bit squirrelly on 10. They have a predeliction to start the entire chassis crawling with RF! Not a nice thing.

You may want to pick up a BC-939 antenna tuner for use with what Uncle "called" long wires. They run 44 feet from 60 through 20, and 77 feet on 160.

Another component is the ME-165 wattmeter, SWR meter, and 400W air-cooled dummy load.

Just all depends where and how you want to go.

Bob - N0DGN

Bob..

Its the military manual, but printed apparently by/for Hallicrafters, since it has all the usual military material front and back, but doesn't carry
any "TM" nomenclature, save one of the packing lists where the TM-II-826 is referenced. Same as the front panel badge below the I model's name rank and serial number (44 3357-PHILA-52).

The closest I'd come on the high end might be 18 mHz as the cycle comes up.
I'm just trying to get ready for next season, since the summer qrn season is starting up here.
I'm breadboarding a breadslicer and roller for the base of the 160m 1/4 wave inverted L, though its been working
ok with a bunch of 5kv doorknob capacitors at the feedpoint. Another shortcoming is the radial department, less than a dozen are in the ground and they are not 360 as I haven't talked myself into crawling under the house to pull the rest of the radials yet.

I'm on 75, 40 and 20 at the time, but have only worked my old friend TimTron on 20. I've had the transmitter on the air permanently since January. I have to work on the 40 meter TU, as I'm not getting enough drive with my 3645 crystal. Using the MO I'm also short on drive, so I'm going to test the tube chain in the exciter and then start troubleshooting the TU-52.

I'm also looking for an I model back panel, if anyone has one laying around the barn!

Thanks and 73 to you Bob....and all the T3 and Beastie fans....sure is fun..

Warren W1GUD
TampaBay, FL

And there is another possibility (if anyone has mentioned it I missed it).
The description in the original incident report of what happened suggests a
sudden catastrophic failure (black smoke). If the failure was the LV secondary
shorting to case, all that would be accomplished by simply plugging in a pair
of SS replacements would be the immediate destruction of the replacements.

Warren,

What you have is what was know as a Contractor's Preliminary or just
Preliminary Manual. Produced to get something into print while the final manual was
being produced. This was done some in the 40's and a lot in the 50's.
Usually, if you look carefully under the photographs , tables and drawings you will
find information that will tell you what the final TM number is going to be.
I've seen cases where it doesn't appear that a final manual was ever produced.
Frequently the preliminary will cover a single letter model and the final
will cover two or more. Which is the case with this one.

FWIW, "3357-PHILA-52" is the Signal Corps Order Number (or one of them) for
BC-610-I's and associated equipment.

Steve,

As Bob said, this isn't what you would call a common problem but it's not unheard of, either. The transformer ratings, for looking for a replacement or rewinding purposes, are 100/115 VAC primary (give or take) and 2.5 VAC/10 A secondary. And the kicker, the secondary insulation should be rated at 10 KV or better.

# 3154. Re: BC-610 on 160 (was Re: Heavy 'anchor' For Sale

Yahoo group: T-368_BC-610
Date: 2008-05-24 15:07:13 UTC
From: wa5cab@cs.com
Topic: 3154  Message: 3154

The TU-47 covers 2.0-2.5 MC. The crystals used in it are already fundamental freq. The frequency modification kit MC-509 that took the BC-610 down to 1.0 MC (and as Bob said requires a slight modification to the transmitter) consisted of the following:

TU-62 1.0-1.5 MC
TU-61 1.5-2.0 MC
C-455 1.0-1.5 MC
C-454 1.5-2.0 MC

Plus a wooden chest and instructions.

The TU-61 is quite rare but as Bob says, the TU-47 can be successfully padded down and used. I have a few C-454's somewhere but (a) I'm sure that by this time, the polystyrene coil supports will be deteriorated and require replacement (which I haven't the time to do) and (b) the C-454 is of the fixed link type, so some external loading means would be required. In the original installation, this was accomplished in the BC-939. The swing link variant is the C-454-A but Murphy says that however many I have are probably all C-454's. The NOSB one I have here at the house is, and as I suspected, the polystyrene is peeling.

hello all, i use the solid state replacements for the 866s, as i was gived a pair by roger, g3vkm. i presume they do not require filament voltage. one day i may put the 866s back when i get round to it ! alan g4gen

NOT True! Actually, due to the design layout, the problem he seems to be
having DOES require the filament transformer to be present, unless a
connection is made from the 2N2367 socket to the input of the HV choke.
If he just pops the rectifiers in and it turns out that there is an open in
the lead
that goes to the choke (physically) there will be NO high voltage output.

Lets first look at the schematic before declaring that it just takes a
device
change as in from 866/3B28 to the 2N2367s to "keep on trucking". It really
does matter if the filament transformer is open, as you would need to make
certain the HV circuit is complete.

As always your mileage may vary. FWIW
Jim

# 3156. Re: Smoked and baked BC610 filament transformer

Yahoo group: T-368_BC-610
Date: 2008-05-25 14:08:23 UTC
From: Steve
Topic: 3134  Message: 3156

Many thanks to those who replied to my initial message. Hopefully we will get this BC610 back on the air. This is the next installment to the ongoing saga:
I disconnected pins 7 and 8 of TS14, effectively removing the primary of T2 from the circuit, and removed the HV rectifier tubes. When I turned on the filament switch, the fuse F4 did not blow (as it had done when the primary was in the circuit), the green pilot light and the filaments of the other tubes lit.
In hopes that the T2 secondary was still intact, I installed solid state replacement rectifiers. After sealing everything (to close the interlock switches), I turned on the HV. But nothing happened. RY1 did not click, and the HV red pilot light did not go on.

It seems that the problem now is in the control circuit. The circuitry is complex, but it does not appear to me that RY1 is dependent on an intact T2 primary.

Does anyone have any suggestions as to what might be keeping the HV control circuitry from coming on?

Many thanks again and 73
Steve WA2DTW

hi steve their are 3 wires going to the hv rect fil
xformer connest the 115v and the 100v wires together
and tape them up after removing them from the pri of
the xformer this will re establish the control the
other primary wire can be disconnected and taped up by
itself.good luck bro ge w8qbg.

hello george, yes, that was what i thought. i was having trouble getting it on air, as the ht would not come on. i thought that the 866s might be faulty.
it was nothing of the sort, the protection switch on the rear panel was not making. a new screw did the job, but i left the solid state units in place. i will replace them with the 866s one day as i like the glow ! cheers, alan

i think ever one who looks at the dia of the bc610
knows that when you disconnect the fil xformer out of
the circuitand install solid state plug in`s in their
place, some minor wire changing has to take
place,however if you leave the xformer in place and
its a good one the change out works fine . DUH, DUH!!!

Many thanks, George, and to everyone else who responded. We're back in business. I reconnected terminal 7 of TS14, leaving terminal 8 disconnected. With the solid state replacement rectifiers in place, the control circuitry was again working, and I was able to get high B+. So- fortunately, the secondary winding of T2 and the portion of the primary between the 100 and 115 volt taps were both still intact.

Hope to work some of you on 160.

Hi Group,

Just to say that I have located a suitable transformer to replace T-102 on eBay. This was an RCA transformer being sold on the audiophiles market but which had suitable impedances, luckily it was also a drop-in replacement for the original. It was auctioned as "RCA MI-11712 vacuum tube audio transformer", might be worth making a note of that number in case one turns up at your next hamfest!

So, I am back on the air on AM and hoping that will be that - at least until the next fault!

That's great Alan,

I'll be QSX on 3615 during the day, so will look out for you. Was on
the G2OT/RAOTA Net yesterday on CW and the '610 excited some interest!
I think I was the only op on the net under 60 and the only one with a
TX older than the op!

OK Alan,

Well, I had a similar problem with those switches, they do not match the mountings on the top cover of my BC-610-E. On the lip of the cut-out for each door there is a small bracket with a hole in it. I fitted a conventional microswitch with an actuator button into each hole and the door operates the switch under its own weight, it seems quite positive in operation and you can hear it open and close, so it gives you confidence it's working. I've a feeling that the switches I've sent you are for another mark, as you say. But having said that, I did check with another BC-610 owner and his -E model had that type, so possibly the top lid on my '610 is off another mark of TX?

Take real care if you run without the interlocks! Just imagine the field-day the HSE jobsworths would have if you get zapped!!!

Roger and Alan,

FYI: The top cover openings "we" normally jumper out of use.
Especially the one on the right. The one on the left "sort of" needs to
be jumpered out of the circuit IF you are going to use a delrin or some
similar "rod" or "stick" to adjust the "swinging/rotating" portion of
the PA coil. The right side being obvious as to frequency adjustment.

The ONLY interlock that is an ABSOLUTE must is the back panel one!

Murphy's Law dictates that if left open - One WILL manage to find
someway to get oneself ZAPPED!

hello bob, i expect that i may do that if i get stuck. however, i am really afraid of someone messing around with it in the future and coming to grief.. it worked perfectly until i lost the lead and switches. the ones from roger fit but not with the brackets. , i made up a bracket today which i mis measured.but it did work. i will do a decent job tomorrow. the switches are a really excellent and simple design. the top cover looks great now it is coated, so i will do the 939 next.
i worked as far as hungary on the whip antennas using it last summer. cheers, alan

Alan,

The whip antennas/insulators are what we refer to as "unobtainium" on this side of the pond!

We usually end up using dipoles OR the "Long Wire" referred to in the manual.

Where in the world did you find a vertical? I'd would LOVE to get one!

Bob,

Until Fair sold out of several numbers about two years ago, the antenna mast sections (at least the first five) had been relatively plentiful in the US, and were cheap. The MP-47 hasn't been plentiful nor cheap but most people who needed one managed to find one. I think I have three left. And one mounting bracket. If you wanted to go up to 24 feet, as you could do with the SCR-299/399/499 and 506 if you used a guy set and three MS-54's, the MS-54's haven't been as plentiful nor as cheap as MS-53...49 used to be. But I currently have over two dozen of them.

Hi Bob,

Alan runs an SCR-399, complete with truck, so he got all the whip antenna stuff with it. I believe they can still be found in Holland and possibly in France as both countries used BC-610s extensively.

hi rob, well they came with the scr 399 truck. we have everything, and it is just as if after hostilities ceased the guys said. "ok , were off home" and left it just as it was. we have the speaking tube and a spare one. there are even mesage pads. it was supposed to have been used in the battle of the bulge, and then when they were chasing the germans back to germany it was left in luxembourg. after the war they gave a lot of stuff to the luxembourg army, and it was last used by them in 1969.. it went to holland, ane we bought it from jan. all we relly have to do is overhaul the pe 95. we rebuilt the roof and roofed it with the proper canvas. i just love operating from it ! cheers, alan

Alan,

The whip antennas/insulators are what we refer to as "unobtainium" on
this side of the pond!

We usually end up using dipoles OR the "Long Wire" referred to in the
manual.

Where in the world did you find a vertical? I'd would LOVE to get one!

hello bob, i have an odd fault just developed. my 610 has been out of use for some weeks while the top cover was coated, and now when i go to transmit the red light stays on after the pressel switch is released. if the set is switched off it resets, but on transmitting the fault occurs again. is this common ? i expect the relay may be sticking, but it seems more likely that it is being locked on somehow. cheers, alan

Alan,

You have me at a good bit of disadvantage on THIS one!

You see, my understanding is that you have the WHOLE SCR-399. I do NOT.

Therefore I deal ONLY with the controls on the front of the BC-610,
BC-314, and the BC-939. I have NO other interconnections.

I believe that you also have the JB-70, along with the remaining cabling.

You "may" have a sticky relay, or an interconnecting cable issue. I'm
really at a loss as to why removing the top panel and putting it back
would have caused this to crop up. I've chewed on this and cannot
fathom the "sequence" of events being significant. I believe the
problem has been "simmering" un-noticed and finally decided to poke its
head up at an inconvenient moment. These old Beasts are REALLY known
for throwing the oddball fit with no explanation. I've got a sudden
"quirk" develop in my first one that has Jim, WB2FCN and myself
scratching our collective head(s).

That sounds like an electrical lock-up for the relay.  Do the resistance  checks in the manual, if you have one, and see if you find a short in the wiring harness.  Maybe even in the microphone circuit.

Alan,

Since you have the WHOLE tamale, I don't know if it is in the BC-610
itself, OR possibly in the JB-70.

Joe suggested checking wiring for resistance and continuity. May well
be a good idea! While you may have only removed the top for
refinishing, what ELSE got disturbed?

Get out the TM. Open the schematic and start tracing from the lamp on
out. See what "may" be causing it to stay energized.
I'm NOT saying this "just" to exercise your knowledge and ability.
Sometimes we need to get back to basics to solve a glitch!

Lord knows I've been THERE! In my case a solder joint broke during
transport some odd number hundreds of miles.

thanks bob. i did not disturb anything except the top cover. there is no noise from the main relay when i operate the pressel switch if the ht light is on. the plate current only flows when the pressel is operated.
if i switch off, then on again, the relay resets.
i will look at it.
on another tack, if you know anyone who wants a complete scr 399 set up, there may be one in holland coming up. cheers, alan

Alan,

Perhaps if Jay Leno was a ham! Today's transportation costs to move a Complete SCR-399 to where I am, build a concrete pad for it OR find an M-35 2 1/2 truck to put it on, are currently outrageous!

Then I have to consider MY lifespan! 1) My wife would CERTAINLY shorten it, AND 2) I have no idea how much of it I would spend starting in ONE corner, then slowly working my way through the remainder to get it in order! That ALSO assumes that all "spares" ARE under the bench!

10 years ago I would "probably" have sought it. Today, I "may" hope to DREAM of it!.

Then again, there is knowledge of WHERE 100 foot long Quonset huts FULL of SCR-399s are NOW. They aren't TOO far from known stockpiles of M-35 (NOT M-35A), 2 1/2 ton trucks are also. This is on YOUR side of the pond. I have no idea WHY they only "dribble" out infrequently.

Hi Alan,

Did you wire up the interlocks on the lid again, and if so are you sure you haven't got any shorts or problems with the wiring? Does the red light go off when you open an interlock, it should.

Roger,

That's one I just don't think about.

The two top cover openings on my two 610s are jumpered out of the circuit.

I go into the right hand side one WAY too often during use. The left hand one gets opened after a band change, and I use a Delrin or Teflon stick under load to alter the link portion of the PA Coil for best operation.

Hi Bob,

I think that the SCR-399 Alan is referring to has been in private hands for a long while and is in need of some TLC. How about some pointers to where that cache of SCR-399s might be? Just the country would be a start :-))

hello roger, as i have not made up a proper plug for the interlock lead, i merely jumpered it. there was a jumper installed in it when i got the rig. i re connected the lead. i have spent most of the day on it, and have checked ry1. it is fine, i cleaned the contacts and lubricated the moving part.just the same.i think the trouble is in the jb70. without taking the tx out of the truck it is almost impossible to do therough checks on it.cheers, alan

Hi again Bob,

OK, well I think you're not alone in that mod, from what others have told me.

It's a shame that Hallicrafters didn't bring the swinging link adjustment out to the front panel. I have a 1950s ex Diplomatic Wireless Service Mark 214 TX here - pair of 813s in the final; it uses coils obviously modelled on the BC-610 coil, with a swinging link but in this case there is an insulated adjusting lever that drops into a attachment on an insulated arm which pulls out from the front panel, works well. Having said that, I don't find a lot of need to tweak the coupling on my '610; I usually set it for max output into a 75 Ohm load and then do all the rest of the antenna tuning at the ATU.

73,

Roger/G3VKM

hello bob. well, it is nice to dream. mine is to win the lottery and buy the ju52 from kermit weeks in florida. i used to fly that one, and i had more fun than anything ! i think there are quite a few 399s over here stashed away. i have checked and serviced ry 1, but no result.it is driving me round the bend. cheers, alan

Alan,

Perhaps if Jay Leno was a ham! Today's transportation costs to move a Complete SCR-399 to where I am, build a concrete pad for it OR find an M-35 2 1/2 truck to put it on, are currently outrageous!

Then I have to consider MY lifespan! 1) My wife would CERTAINLY shorten it, AND 2) I have no idea how much of it I would spend starting in ONE corner, then slowly working my way through the remainder to get it in order! That ALSO assumes that all "spares" ARE under the bench!

10 years ago I would "probably" have sought it. Today, I "may" hope to DREAM of it!.

Then again, there is knowledge of WHERE 100 foot long Quonset huts FULL of SCR-399s are NOW. They aren't TOO far from known stockpiles of M-35 (NOT M-35A), 2 1/2 ton trucks are also. This is on YOUR side of the pond. I have no idea WHY they only "dribble" out infrequently.

Bob - N0DGN

Hi Alan,

Did you wire up the interlocks on the lid again, and if so are you sure you haven't got any shorts or problems with the wiring? Does the red light go off when you open an interlock, it should.

For those old guys who remember the BC 610 when it was top of the line and we would kill to get one..Then discover that it was really a nightmare..
the initials BC stood for ..yes ,you remember..and the 610 told us how many years..
The were other names too..sounds like they may still be approriate..Hi..Hi
Good luck and have pat ience with the old beast..she will come around when she gets good and ready.

Alan,

Try checking the coil terminals of that relay when it is keyed, if it still has voltage on it when you release the button then you're getting a feed back from some where that is keeping it picked.  Of course, if there is no voltage on the coil terminal then it is a sticky relay.

The T-368 has a relay that keeps the transmitter on for a few milliseconds to keep from cutting short the last Morse code element sent, I don't know if the BC-610 has that or not but it may be a source, or example, of that type of problem.

Otherwise it could be something completely unexpected causing a feedback on that control circuit, feel free to suspect everything.

Joe

Please describe the "Doublet" system that you are using! Also another query,
what sort of plate current are you getting when you tune the transmitter
into
a 50 ohm load?

I have been reading the earlier messages about this problem, and I have a
sneaking
suspicion that you have left something important to the diagnosis of the
problem
out.

Also, another question what is the AC power source and level to the
"System",
Just interested.

The out put impedance of the 610 is not 50 ohms...Still you should have a bunch into 50....The tube sounds iffy
Throw the thing off resonance and see how much the tube will put out....Charlie

Please describe the "Doublet" system that you are using! Also another query,

what sort of plate current are you getting when you tune the transmitter

into

a 50 ohm load?

I have been reading the earlier messages about this problem, and I have a

sneaking

suspicion that you have left something important to the diagnosis of the

problem

out.

Also, another question what is the AC power source and level to the

"System",

Just interested.

The output impedance of the BC-610(E) thru (I) is 50 ohms, read the manual!

The link coupled output works into a 0 ohm load, both the swinging link version and the fixed link version. The output is coupled to various types of loads
mostly whips mounted on the shelters of the 2 and 1/2 ton trucks shelter. Let us
not worry that it ISN'T 50 ohms it IS. The coupling device is/was the BC-939 antenna coupler. Let go of the misconceptions read the manual.

The reason I asked what power output/plate current readings he is getting is into the PROPER output load the current being correct would provide a starting point for working through the low output problem.

Maybe I'm off the black-list. I've tried to respond to several comments, but all attempts never went through.

One thing that I said in response to the sub-thread about disabling the safety interlocks is that anyone doing it hopefully has a lot of paid-up life insurance and a current will listing who get's the 610. I once survived discharging the HV capacitors in a -E model (open bleeder). But I can't recommend the experience.

Another is that the -E and earlier models all originally shipped with fixed link coils. The variable link coils were part of the doublet antenna modification kit.

And a third was that it's too hot to go looking in the attic for TM 11-281 but unplug the JB-70 from the BC-614 and see whether the relay still latches. If it does, unplug the BC-614 from the BC-610. If it still does, problem is somewhere in the 610. Otherwise, it's in whichever one fixed the problem by unplugging it.

I've forgotten the rest.

Well said Robert,
I was of a similar mind about the isolation of the problem. The doublet antenna
mods were what I was referring to as well. That pertains to the comment about
having low plate current.

The system in its entirety is relatively straight-forward to use, as long as one
doesn't try to make it do something it wasn't designed for, without modifying
the units involved. The original "E" model with the fixed links were for a specific
antenna, folks think that means they can stick just anything on the end of the
thing and it will act like one of the newer rigs, it WON'T!

Good info there Robert, first thing to do is always have the manual handy.
Makes for an easier time all around. FWIW.

# 3203. Re: [T-368_BC-610] Fault

Yahoo group: T-368_BC-610
Date: 2008-06-17 07:52:35 UTC
From: Alan Morriss
Topic: 3201  Message: 3203

hello robert, nice to hear from you. i am sure that the fault is in the jb70. i thought that it might be because i had removed the bc 342 for repaiir as smoke came out of it, but re connecting it did nothing. i checked the relay and dressed the contacts with a diamond file as well as lubricating the moving parts. no result.
as a tempory measure i jumpered the socket for the top cover protection circuit , and on removing the link, the light went out. as i have mislaid the original lead and switches whilst the cover was away, roger sent me a couple of switches and i made up a replacement. the brackets on the switches do not fit my cover, so i had to make the replacements.
do you have the proper plug for the socket ? i would also like proper brackets. they are simple bent strips with the holes parallel.
i also had a shock from the 610. like a fool, i touched the tank coil to adjust the link, forgetting that as i was on cw the light was still on as i had forgotten to cancel transmit. i did not enjoy it all that much, and the trip went. that taught me a lesson!
cheers, alan

hello, the doublet is fed with 450 ohm feeder and is cut for 3615 accurately. the only way it matched was using the proper coax feeder . however the matchbox does a lovely job and gives rx antenna connection.
the plate current behaves normally when off resonance. oh well, i suppose it will keep me busy in my old age ! cheers alan

hi, yes, the manual says 75. i think that as the johnson matchbox presents 50 , that may be the cause. it really does not matter, as the coil does not get hot, and it keeps the power legal ! i can off tune the matchbox a little to get the proper current, but the vswr goes up to around 4:1 cheers, alan

>

The tube wont put out a ny thing, off-resonance. it'll draw excesive amounts of plate current (if good, and thus the reason for the test).

Ozona Bob/W5PYT used to do that. John Mohn/W5MEU asked me one time "how long do you think those tubes will last, doing that to 'em?" That's when I stopped doing that to -my- 250TH's. Then again, I don't run much more than 1000 to 1500v on mine (have pair in home-brewed final, pair in home-brewed modulator) and at 1000v or less, small off-resonance excursions have taken the current past 350mA... and I never drew more because it exceeded the dissipation of the plate. On the other hand, I've run as much as 3000v on a pair of 250TH's, and making sure the tank was resonant saw the thing draw 400mA (link coupled).

Amazing tubes, those 250TH's... I'm guessing at one time they were more than plentiful. The jarring in the back of a duece-and-a-half wouldn't be very friendly to those thoriated tungsten filaments. The grid is rather weak, also. These days, some places are getting 'hundreds' of dollars 'per tube'. They're getting quite rare (expensive) as well as hard-to-find.

Take it easy on those tubes, Charlie.

BTW, did you ever sell that BC-610 you brought and demonstrated at Belton a few years ago?

I can't agree to that. I had a E model, and it had swinging coils.

The firdt thing that popped to mind, Robert, was that the coils you had
in the E model were probably old and the link was 'stuck' in the middle
position. Not to say that they don't exist, but I've never seen a 610
coil with a 'permanently fixed' link coil inside the tank coil.

Subject: Re: [T-368_BC-610] Fault

Maybe I'm off the black-list. I've tried to respond to several comments, but
all attempts never went through.

One thing that I said in response to the sub-thread about disabling the
safety interlocks is that anyone doing it hopefully has a lot of paid-up life
insurance and a current will listing who get's the 610. I once survived
discharging the HV capacitors in a -E model (open bleeder). But I can't recommend the
experience.

Another is that the -E and earlier models all originally shipped with fixed
link coils. The variable link coils were part of the doublet antenna
modification kit.

And a third was that it's too hot to go looking in the attic for TM 11-281
but unplug the JB-70 from the BC-614 and see whether the relay still latches.
If it does, unplug the BC-614 from the BC-610. If it still does, problem is
somewhere in the 610. Otherwise, it's in whichever one fixed the problem by
unplugging it.

I've forgotten the rest.

Alan,
The statement here is confusing, "Must be the English to English"
translation.
Am I correct in this regard? First you are using a (dipole) you say
"Doublet",
which is fed with a 450 ohm feed-line, and cut for operation at 3615.

Next the statement is: "that you needed to match the 450 ohm feeder to a
proper
coax feeder", and this is accomplished by using a Match-box, I am assuming
johnson type, as per the mention of the RX antenna connection.

If this is a johnson matchbox, are you also using the T/R relay capabilities
of the
matchbox? Then I would ask if the output of the BC-610 is going to the
match-box and thence the antenna.

I would also restate my original question, have you in fact tuned directly
into
a 50 ohm load to determine that the transmitter is properly working?

Curiosity abounds OM!

# 3214. T-368_BC-610] Re:fault

Yahoo group: T-368_BC-610
Date: 2008-06-17 13:12:45 UTC
From: James M. Walker
Topic: 3214  Message: 3214

In this case I am assuming you mean the manual for the Johnson Matchbox.
The matchbox accepts a "50 ohm input and matches to antennas having a range
of
50 - 1200 ohms for balanced lines and 50 to 2000 ohms for unbalanced lines",
This is adding to the confusion of your statement below.

Please clarify.

From: James M. Walker
Topic: 3201  Message: 3215

I have currently the "E" and "I" models and both have 50 ohm output and variable adjustment links.

I "think" there were fixed coils used in the SCR-299 system, not sure. The 299 was in the "Ambulance" truck configuration, and only had whips and a coupler assembly that did the match/load function.

I can't agree to that. I had a E model, and it had swinging coils.

The firdt thing that popped to mind, Robert, was that the coils you had
in the E model were probably old and the link was 'stuck' in the middle
position. Not to say that they don't exist, but I've never seen a 610
coil with a 'permanently fixed' link coil inside the tank coil.

hello george, i carefully did the contacts today with a diamond file. they are perfect, and i also lubricated the moving parts. it all made no difference.
another thing. i am feeding the doublet via a johnson kilowatt matchbox. the vswr is around 1.5 to1.

i am only getting around 100 ma plate current at max coupling of the link. cheers, alan

Alan,

Try checking the coil terminals of that relay when it is keyed, if it still has voltage on it when you release the button then you're getting a feed back from some where that is keeping it picked.& nbsp; Of course, if there is no voltage on the coil terminal then

it is a sticky relay.

The T-368 has a relay that keeps the transmitter on for a few milliseconds to keep from cutting short the last Morse code element sent, I don't know if the BC-610 has that or not but it may be a source, or example, of that type of problem.

Otherwise it could be something completely unexpected causing a feedback on that control circuit, feel free to suspect everything.

Joe

hello joe, that sounds promising. i tried disconnecting the mike, but no different. i am suspicious of sticking contacts for the main ht supply, as it worked perfectly until i left it unused for some weeks. one other thing, i am now using a johnson kilowatt matchbox to couple to the doublet, and even with the link parallel to the windings in the tank coil, i only get 150 ma plate current. the vswr is about 1.5 to 1, so it should do better. any ideas ? cheers, alan

I don't recall the details of all of the differences (the sheet metal, meters and switches are obvious) but aside from tubes, tuning units and tank coils, relatively little of the -F and later will properly fit the -E and earlier. Including the top cover.

The swinging link coils were initially supplied as part of the doublet antenna modification kit. The original BC-610-E and earlier all shipped with the fixed link coils.

Hey guys, remember these were built under contract to the lowest bidder..at the time...and his plan was to make all others INCOMPATIBLE..thereby creating a market for pieces, parts, upgrades,etc.
Now we are trying to recover from it. The fun in B/A ham radio is making it work..as close to ORIGINAL MIL SPEC as we are capable of doing.
Nobody ever said it would be easy. Keep up the good work.

Alan, I have done some tests here this afternoon with my SCR-499, BC-610E serial 4427, input votage114.7v on standby and 108.2v on transmit full power (4kva Variac). Coil is swinging type with inner coil at roughly 45 degrees. I have run it into the ME-165G dummy load and results were PA current 220mA, PA grid 65mA, power output on 3.615mhz was 275W. Into the dipole (doublet) via the Johnson Kilowatt matchbox PA current is 190mA and PA grid is 65mA. output is also 275w carrier. SWR is 1.0:1.
The modulator bias is set at 40mA and PA filament is 5.3v the int amp plate is 150mA in both instances and the int amp grid is 6mA.
The JBox settings are:- both RX disabling ON, Trans OFF, cw sidetone OFF, battery PE-95, rx output NORMAL.
I have a full set of both coil types and coils also to 1.0MHZ. they all came with this set which is complete with all units, cabinets and seats etc. date manufactured is Sept/Nov 1944.

Robert, Charlie, Et Al,

1 - Ive ONLY run across TWO PA coils that DIDN'T have rotating links out of over two complete sets including the complete set I obtained from Lon Cottingham. So the "premise" that THEY were ALL non-movable is hogwash!

2 - The impedance for the output has ALWAYS been 50 ohm. Where ANYONE gets the idea that it is/was otherwise demonstrates an absolute LACK of knowledge AND failure to RTFM! (Read The Frickin' Manual)

3 - Disabling the two TOP interlocks is ONLY dangerous IF you go about doing things in a "cavalier" manner! I spent a portion of a "past" life working high voltage distribution systems and high voltage generation. (The "lowest" voltage was 4160VAC, up to 22KVAC.) I have NEVER used any manner of working HV except with ALL the appropriate safety precautions. I have and DO use "hotsticks", HV Probes for troubleshooting, and even HV gloves tested and rated for 20KV.

That being said, how do you propose to make ANY useful voltage checks to ascertain where and what the "problem" may be IF you DON'T have an energized circuit? I'm NOT Johnny Carson playing the Great whatever holding envelopes to my head and proposing to know the answer! There have been infrequent need to have the Plate Power ON while using the HV DC probe to ensure that FULL PLATE voltage was INDEED present. The reason was that the Plate Current would NOT exceed 38mA. This begged the question as to whether the VOLTAGE was correct. The final had already been swapped out with a KNOWN GOOD one BEFORE this method was resorted to.

IF you are going to own, operate, and maintain BAs or Amps with HV, There WILL come the time when you MUST perform your tasks while circuits are HOT! Try tuning the input circuitry on an Amp Supply LK 500 or LK 800. You MUST have the lid open, (off actually), completely powered up, fed RF from your exciter, and the dummy load in use - WHILE you adjust the input circuits to tune for the exciter's low SWR requirements.

I'm NEITHER insane, stupid, NOR have a death wish! Unlike way to many out there with "like" equipment, I "DO" know what I'm doing, the smart, SAFE way to do it, AND I "ALWAYS" practice the level of safe practices.

I ONLY go into the top left panel to adjust the rotating coil while energized when I MUST rotate the link to us an area of the dipole that the antenna is NOT resonated for, and am trying to properly load the transmitter and NOT blow the final.

In summary, I suggest to those making "not bright" comments on MY doings with regard to High Voltage, either STAY AWAY from such Beasts, AND/OR

write ME direct. I'll attempt to educate YOU!

# 3226. The Fault Issue

Yahoo group: T-368_BC-610
Date: 2008-06-17 18:10:09 UTC
From: rbethman
Topic: 3226  Message: 3226

Now on to the "fault".

The inclusion of "I removed the top to be coated.", has ABSOLUTELY nothing to do with what is wrong.

Alan further states that he took a BC-348 out of line because "it let its *smoke* out" - probably has a signifiicant bearing on what is causing the fault!

We've talked about the contacts sticking on the relay, the proposed method of disconnecting cables until we get down to just the BC-614 and the BC-610 is a VERY good and valid process. This "almost" HAS to be a cabling/connector issue whereupon something is suddenly grounded that isn't supposed to be OR "some" leakage current that is keeping things "stuck".

Question #1 - Red Lamp. Which one? Is this the Plate Power Lamp? Is it on the JB-70? ( I do not have one - so I do NOT know if it does - BUT - it would make sense that it does since it ALSO controls the PE-95 remotely.)

Question #2 - Which SPECIFIC switch are you cycling off then on to make the red lamp go out?

Bob - N0DGN

Topic: 3201  Message: 3227

Sorry, Geoff. I didn't say that some BC-610-E bought in the 50's or later would have had nothing but fixed link coils. But what the first guy to open the crate in 1941, 2 or 3 would have found wouldn't have been variable link types. I've got a bunch of them, including as I mentioned a few weeks ago some for 160. I'm looking at one of those as I write this (or it's box to be precisely correct). Ask Lon about them. That's where many of them came from.

If you look at the tuning charts printed in the back of the TM 11-281's dated 17 April and 04 September 1943, you will see that the coils listed are all either -A or -B models, which are the fixed link coils. The variable link coils are all either suffix -C or -D.

Also, the fixed links are not inside the tank coil, they are outside of it

Joe,

Did you have to clear the below or did it go through on its own? I deleted
the URL and two email addresses from my standard signature block.

We'll just have to agree to disagree, Bob. When I had my '610-E, and I wanted to change how the thing was loading, I'd make sure the B+ was off, and adjust the swinging link a little at a time, and there's simply just no way in HELL I'd ever temp fate by sticking my hands in that beast with the B+ on.

I, too, have learned my lesson with the home-brew rig... luckily the Vari-AC was turned down so that the DC output was only around 600vDC but that was enough to knock me out of my chair, out of the room and across the hall, landing in a rather unceremonious manner, upside down and 'knocked out' for a couple of minutes!

Then, there was the 'snake-bite' I had on my upper right hind-quarter. Exposed 1200VDC terminals from a home brew 811A power supply grabbed my butt when I bent down to pick something up. naturally, I lunged forward, knocking my head on whatever I was working on, which knocked me -back- into the powersupply, where I finally had the presence of mind to stand UP instead of knocking my head against the equipment, again. Luckily, this time, I had rubber soled tennis shoes on and the scaring was minimal. Can't say the same for my right thumb and left palm... right thumb was exposed to the 600v DC... right palm had the D-104 in it.

I will continue to work with tube-type rigs, but I'm -never- going to stick my hands, or any other part of my anatomy near an energized HV circuit, ever again.

Geoff.

You just proved MY point!

I do NOT stick MY HANDS in there!

I reiterate - I USE EITHER A HOTSTICK OR TESTED AND RATED @ 20KV HV GLOVES TO WORK LIVE CIRCUITS!!!!

I was VERY well trained in working LIVE circuits. I used to HAVE to use a HOTSTICK to tie the 1MW portable generator to the OVERHEAD distribution to provide emergency power. I've even done it in the rain!

Once you KNOW what, how, and the methods, it is NOT a widow maker!

If you wish to disagree, that's fine by me! Since you "backed" into the 600 V plate, OBVIOUSLY you live on the "edge" since it WAS exposed. What I'm dealing with is NOT! It is in the cabinet. I have to WORK at getting in there to do what I do.

This is where myths, legends, and Fairy tales get started! All in lieu of FACTS, KNOWLEDGE, TRAINING, and EXPERIENCE.

# 3233. BC-610E forsale with accessories

Yahoo group: T-368_BC-610
Date: 2008-06-17 19:54:30 UTC
From: Mikhael (Mike) Brown
Topic: 3233  Message: 3233

I have a BC-610-E for sale with the following:

BC-614 Speech Amp
BC-939 Tuner
JB-70 Junction Box
all coils from 160 meters up
all Tuning Units from 160 meters up
BX-34 crystal box
Some Crystals for 160, 80 and 40 meters
KY-116 leg iron and T-50 mic
With all tubes
Spare Tl-250
Original Manual

I located am in Oakhurst, Ca, 50 miles north of Fresno.

Selling it all as one package, PU only, unless you want to arrange
packing and shipping.

Pictures available, will email them if you drop me a message.

Contact me offline:
Mike, N6WIG
mikhael@...

Hi Mike,

We've BEEN reading your posts!

It is just:

1) I'm in Virginia - Too far to come pick up! Fuel makes it
prohibitive EVEN before the BIG rise!

2) I too am downsizing. Marching orders from delightful, wonderful,
and (so far) understanding XYL of 38 years! *Thin the herd!"

# 3235. Top panel access hatch interlocks

Yahoo group: T-368_BC-610
Date: 2008-06-17 20:34:45 UTC
From: rbethman
Topic: 3235  Message: 3235

I found by accident another reason for jumpering THOSE interlocks.

It has NOTHING to do with placing one's hands in there either!

I was using the BC-939 with the "long wire" ability. I slipped off one of the knobs trying to rapidly get it tuned prior to final MELTDOWN, - AFTER - setting the matching device to the presets, and banged the top of the entirely closed BEAST.

Yep! Sure as the day is long, one of the two panels moved JUST enough to cause the interlock to come into play. It blew the BIG front fuse just as it is supposed to. Now I don't know about YOU folks, BUT I firmly believe these OLD Beasts may well develop other MAJOR issues with terminating power under those conditions!

I "prefer" to turn off the Plate Power in a graceful manner by use of the switch. You CANNOT make a short trip to a "RADIO" shop and obtain replacement parts!

I'll leave MY interlocks JUMPERED, my HANDS outside - UNLESS I'm performing NECESSARY checks and adjustments.

I also HAD to perform voltage checks, (HORRORS!), with the BACK cover off and a "temporary" interlock work-around, because the 100THs were unbalanced in their filament illumination. This indicated that I *NEEDED* to measure voltage while ENERGIZED. This time it was ONLY filament power.

The problem was either a loose connection or corrosion. Checked the voltage, located WHERE, and fixed the problem AFTER turning off the BEAST along with REMOVING the power cable, letting the bleeders work AND the use of a shorting stick! Which *should* be an FCC requirement to be on the premises and readily available!

# 3236. Re: [SPAM][T-368_BC-610] The Fault Issue

Yahoo group: T-368_BC-610
Date: 2008-06-17 21:27:07 UTC
From: Alan Morriss
Topic: 3236  Message: 3236

hello bob, you are right ! the trouble was that i left it not working for weeks. this afternoon i disconnected the plug on the rear of the 610 which goes to the jb 70 when the red ht light was on as usual. it made no difference, so the trouble must be in the tx.
i put a couple of leads into the top socket instead of the jumper, and could deactivate the ht that way, but the relay was still energised, as the light came on as soon as i re connected the leads.
i was still only getting 50 ma plate current with a properly matched antenna, with a vswr of 1.5 to 1.however.
after a bit the plate current suddenly disappeared altogether, but the light was on. as i couldnt get it on
again i gave up and went home for tea ! it is driving me mad . one problem id that in the shelter there is very little room behind the tx to enable it to be worked on. oh well, it keeps me busy. cheers, alan

Subject: [SPAM][T-368_BC-610] The Fault Issue

Now on to the "fault".

The inclusion of "I removed the top to be coated.", has ABSOLUTELY nothing to do with what is wrong.

Alan further states that he took a BC-348 out of line because "it let its *smoke* out" - probably has a signifiicant bearing on what is causing the fault!

We've talked about the contacts sticking on the relay, the proposed method of disconnecting cables until we get down to just the BC-614 and the BC-610 is a VERY good and valid process. This "almost" HAS to be a cabling/connector issue whereupon something is suddenly grounded that isn't supposed to be OR "some" leakage current that is keeping things "stuck".

Question #1 - Red Lamp. Which one? Is this the Plate Power Lamp? Is it on the JB-70? ( I do not have one - so I do NOT know if it does - BUT - it would make sense that it does since it ALSO controls the PE-95 remotely.)

Question #2 - Which SPECIFIC switch are you cycling off then on to make the red lamp go out?

Subject: Re: [T-368_BC-610] Re:fault

Alan, I have done some tests here this afternoon with my SCR-499, BC-610E serial 4427, input votage114.7v on standby and 108.2v on transmit full power (4kva Variac). Coil is swinging type with inner coil at roughly 45 degrees. I have run it into the ME-165G dummy load and results were PA current 220mA, PA grid 65mA, power output on 3.615mhz was 275W. Into the dipole (doublet) via the Johnson Kilowatt matchbox PA current is 190mA and PA grid is 65mA. output is also 275w carrier. SWR is 1.0:1.
The modulator bias is set at 40mA and PA filament is 5.3v the int amp plate is 150mA in both instances and the int amp grid is 6mA.
The JBox settings are:- both RX disabling ON, Trans OFF, cw sidetone OFF, battery PE-95, rx output NORMAL.
I have a full set of both coil types and coils also to 1.0MHZ. they all came with this set which is complete with all units, cabinets and seats etc. date manufactured is Sept/Nov 1944.

h1 jim, the matchbox presents a 50 ohm load. the manual for the bc 610 says in the doublet section that the impedance of a dipole at centre is 75 ohms so the tx gives the same.hope that is clearer. cheers, alan

Subject: [SPAM][T-368_BC-610] T-368_BC-610] Re:fault

In this case I am assuming you mean the manual for the Johnson Matchbox.
The matchbox accepts a "50 ohm input and matches to antennas having a range
of
50 - 1200 ohms for balanced lines and 50 to 2000 ohms for unbalanced lines",
This is adding to the confusion of your statement below.

Please clarify.

Please describe the "Doublet" system that you are using! Also another query,
what sort of plate current are you getting when you tune the transmitter
into
a 50 ohm load?

I have been reading the earlier messages about this problem, and I have a
sneaking
suspicion that you have left something important to the diagnosis of the
problem
out.

Also, another question what is the AC power source and level to the
"System",
Just interested.

Alan, I was just reading the comment about removing the cable to the speech amp (you say JB) but it must be a cable to one of the interlocks shorting to ground somewhere or the interlock switch shorting to ground, looking at the circuit diagram it is taking the ac line to ground and turning the light on as well as activating the relay. check sw5 on the rear of the modulator apron unlikely unless you have the ac supply inverted and the two on the top cover. sw2 and sw13. check for chafing where the cables pass through the clips at the corners. regards Max

Alan,

Now I "see" where you are getting the numbers a "bit" confused.

A doublet, (dipole) is indeed about 73 ohms at the FEEDPOINT in the middle where you connect the coaxial cable.

However, that does NOT translate to 75 ohms at the transmitter end of the coaxial cable.

The only thing that happens, is that there IS a "slight" impedance bump AT the feedpoint.

I have an antenna analyzer here. I feed my dipoles/doublets with with RG-213 or Belden RG-8. When I put the analyzer on the coaxial connector in the shack, I read flat 1:1 with it showing 50 Ohms.

It can be a "bit" confusing, however that is how dipoles/doublets have ALWAYS worked from MY experience of almost 30 years in this hobby.

hello jim, well i define a dipole as one which is cut to a particular frequency, and fed with a 75 ohm feeder. a doublet thr term used in the manual is supposed to be set for the frequency in use. however they can be of any length with equal legs, if fed with twin feeder of a high impedance. the feeder as used in the scr 399 is about 3/4 inch diameter coax of 75 ohm impedance.
it worked perfectly without any atu but i dont like to leave it exposed to the weather permanently, so i used the 450 ohm ribbon feeder because i picked up a kilowatt matchbox. i expect i will be about 80 years old before i get it all going ! cheers, alan

Alan,
The statement here is confusing, "Must be the English to English"
translation.
Am I correct in this regard? First you are using a (dipole) you say
"Doublet",
which is fed with a 450 ohm feed-line, and cut for operation at 3615.

Next the statement is: "that you needed to match the 450 ohm feeder to a
proper
coax feeder", and this is accomplished by using a Match-box, I am assuming
johnson type, as per the mention of the RX antenna connection.

If this is a johnson matchbox, are you also using the T/R relay capabilities
of the
matchbox? Then I would ask if the output of the BC-610 is going to the
match-box and thence the antenna.

I would also restate my original question, have you in fact tuned directly
into
a 50 ohm load to determine that the transmitter is properly working?

Curiosity abounds OM!

Alan,

As Max has pointed out, either the interlock is "somehow" providing leakage current, or SOMETHING in the harness is chafing, OR where the terminal strips for each deck is has gotten something rubbing.

Roger,

Minor point but the 8-wire cable that plugs into the rear of the BC-610-E goes to the BC-614.

What is the Order Number and Serial Number of your transmitter? I was going to have a quick look at the schematic (since I had gone to the trouble to locate and bring downstairs the two early manuals and confirm when the adjustable link coils showed up) and noticed in the front of one of them that there were production changes made in the circuit you're apparently having trouble with.

Max,

That is ONE possibility. The other may simply be that the ME-165
function switch OR the resistors need to be reseated.

The dummy load in the ME-165 IS 50 ohms.

The length in feedline, coaxial connectors, and the above WILL VERY
slightly indicate a MINOR variation in readings.

From: M0GHQ
Topic: 3251  Message: 3251

Alan, I have sat down and looked at this very carefully, RY1 and RY4 the antenna relay are in parallel with each other, I think you may have a problem not in the transmitter but in the Matchbox, disconnect the Matchbox and go back to the BC-939 and see if the problem resolves itself. Maybe that someone has altered the relay or switching arangement in the Matchbox and upsetting the relays, that would also explain why you are getting low PA current if there was a fault in the Matchbox and why the BC-342 smoked up maybe the Matchbox is not switching properly and the smoke was RF in the receiver that was supposed to be going to the antenna and in fact ended up in the BC-342.
Is the antenna relay RY4 activating as well or did you disconnect it when you connected the Matchbox? , Regards Max

I'll agree on that one!

The manual that Charlie provided the link to does indeed say "73 ohm 400W noninductive dummy load".

Yet, the ME-165 manual states that it is a 50/51 ohm 600W non-inductive dummy load, TM 11-6625-333-15.

So I do NOT know if there is a mis-print, or if Charlie's manual is outdated with an error. My "hard copy" TM 11-826 IS definitively a "later" printing including TO designation, and it is labeled Dept of the Army and Dept. of the Air Force.

So whom knows?

I know without question that MY -I and my T-213 want and love 50 ohms.

The manual that Charlie provided the link to does indeed say "73 ohm
400W noninductive dummy load".

Yet, the ME-165 manual states that it is a 50/51 ohm 600W non-inductive
dummy load, TM 11-6625-333-15.

My TM 11-826, in the SAME paragraph number says something ENTIRELY
different!

It states: The dummy antenna consists of a series connected 146 ohm,
400-watt resistot and a 50 uuf capacitor.

So whom knows?

I know without question that MY -I and my T-213 want and love 50 ohms.

# 3254. ME-165 in line

Yahoo group: T-368_BC-610
Date: 2008-06-18 00:08:13 UTC
From: rbethman
Topic: 3254  Message: 3254

Max,

I do NOT leave my ME-165 in the path from the BEAST to the antenna. The ONLY time I have it there is for testing.

I use a Bird with peak reading built-in to leave in the path for monitoring output power and SWR. I monitor output waveform with an SM-220 w/BP-8.

The ME-165 just doesn't have enough power reading ability, and really isn't up to the SWR ability of my Bird. All I have to do with the Bird is rotate the element. Reflected power becomes VERY obvious. I've never even seen it wiggle.

I have to setup another radio with intentional tuning off resonance to see the reflected power come into play with the Bird.

Bob,

ME-165/G is a generation newer than the BC-610. It was made for use with T-368/URT, which does have a nominal 50 ohm output. It was never intended to be used with the 70 ohm output HT-4, BC-610 or T-213/GRC-26.

Dennis,

I left off the part starting with TRANSMITTER.

The ONLY thing EVER meant to go after the BC-939 is the designated whip
OR the specified "long wire" as listed in the tables OR the tuning cards.

Robert,

I suspect based upon empirical data, namely the Bird wattmeter, the normal PA Current readings, AND my antenna analyzer, that BOTH my BC-610(I) and my T-213 load very happily load into 40mtr and 20 mtr dipoles fed with RG-213, that the BEASTS will load on a SPAN of impedances from 50 to 70ohms.

So we yet learn MORE about these wonderful old BAs!

Geoff.

You just proved MY point!

I do NOT stick MY HANDS in there!

I reiterate - I USE EITHER A HOTSTICK OR TESTED AND RATED @ 20KV HV GLOVES TO WORK LIVE CIRCUITS!!!!

I was VERY well trained in working LIVE circuits. I used to HAVE to use a HOTSTICK to tie the 1MW portable generator to the OVERHEAD distribution to provide emergency power. I've even done it in the rain!

Once you KNOW what, how, and the methods, it is NOT a widow maker!

If you wish to disagree, that's fine by me! Since you "backed" into the 600 V plate, OBVIOUSLY you live on the "edge" since it WAS exposed. What I'm dealing with is NOT! It is in the cabinet. I have to WORK at getting in there to do what I do.

This is where myths, legends, and Fairy tales get started! All in lieu of FACTS, KNOWLEDGE, TRAINING, and EXPERIENCE.

From: Alan Morriss
Topic: 3226  Message: 3265

hello bob, the model is bc 610 e, and the serial number is 706. i love that tx, and am gradually getting it into condition. i am now getting 210 ma plate current into a vswr of 1.5 to 1. things are looking a bit better, but the ht light is still on. i have a lead and switch into the socket for the protection circuit, and can put it out that way. i disconnected the matchbox relay, but it makes no difference.there might be a ground fault in ry 4, and tomorrow i am going to disconnect that. oh well !
do you have the brackets for the top cover switches ? i would also like a proper plug for the socket if such a thing exists.
the brackets i made do the job, but i really would like proper ones. cheers, alan g4gen

Roger,

Minor point but the 8-wire cable that plugs into the rear of the BC-610-E
goes to the BC-614.

What is the Order Number and Serial Number of your transmitter? I was going
to have a quick look at the schematic (since I had gone to the trouble to
locate and bring downstairs the two early manuals and confirm when the adjustable
link coils showed up) and noticed in the front of one of them that there were
production changes made in the circuit you're apparently having trouble with.

oh thanks bob. well, i dont like coax as much as open wire feeder. i use 600 ohm line into a doublet of 97 feet each leg for my main station antenna. it is matched by a harris rf 601 auto coupler, and i can get out on any frequency. the bc 610 is kept in our tank shed with the other military vehicles. the antenna for that is a doublet cut to 3615, and fed with 450 ohm feeder.this is matched to the bc 610 by the matchbox which is a marvellous thing i think.
most of the operation with the 619 has been using thw whip. cheers, alan

Alan,

Now I "see" where you are getting the numbers a "bit" confused.

A doublet, (dipole) is indeed about 73 ohms at the FEEDPOINT in the
middle where you connect the coaxial cable.

However, that does NOT translate to 75 ohms at the transmitter end of
the coaxial cable.

The only thing that happens, is that there IS a "slight" impedance bump
AT the feedpoint.

I have an antenna analyzer here. I feed my dipoles/doublets with with
RG-213 or Belden RG-8. When I put the analyzer on the coaxial connector
in the shack, I read flat 1:1 with it showing 50 Ohms.

It can be a "bit" confusing, however that is how dipoles/doublets have
ALWAYS worked from MY experience of almost 30 years in this hobby.

How do you get the feeders out of the HO-17? Or is the RF601 external to the Shelter?

Also, you gave me the serial number earlier but instead of Order Number you gave BC-610-E, which I already knew.

# 3270. Re: [T-368_BC-610] Re:fault LONG

Yahoo group: T-368_BC-610
Date: 2008-06-19 02:14:20 UTC
From: James M. Walker
Topic: 3270  Message: 3270

Ah,
Point of fact the RF-601 feeds either a single end-fed wire, or a whip.
It will load up a 32 gallon garbage can from 1.5 to 30 Mhz! Single wire to
antenna, ground to a ground stake. Ask me how I know!

These descriptions of the antenna system(s) is getting very strange.
I use the following setup for transmit.
BC-610 to B&W 6 position coax switch. Common on the B&W switch
goes VIA 50 ohm coax to ME-165 input, ME-165 output goes via 50 ohm
coax to the input of a Johnson KW matchbox thru the SWR detector(directional
coupler), the output from the matchbox goes to a single wire which runs for
153 feet (Long-wire) antenna and a 4 foot piece of #4 stranded to an 8 ft.
ground rod.

When I the BC-610 on a different band necessitating retuning of the SYSTEM
I first put the BC-610 in standby. Then set the ME-165 to the power
position.
BC-610 goes to transmit in the tune position. Dip the plate current on the
PA
Tube.

There is effectively a 400 watt 50 ohm dummy load at the antenna port of
the BC-610. I switch to standby at the BC-610, and change the ME-165 to the
adjust position and set the pot (ADJUST) for full scale on the meter of the
ME-165.

I change the ME-165 switch to the SWR position, key the BC-610 and
adjust the input and output caps on the KW matchbox for minimum on the
ME-165 meter.

At this point I have minimized the reflected power coming back from the
antenna
through to the ME-165 Trust me it is low!

Put the BC-610 in standby, switch the ME-165 to operate, which places the RF
path directly to the matchbox, the BC-610 is now transmitting into the
antenna
as its load device. At the matchbox I "Check" the FWD/REF with the switch
on the matchbox. to make sure things are OK. With the BC-610 keyed and
going to the matchbox I should still see a low reflected reading this time
from
the matchbox and its' associated controls, little if any adjustment should
be
necessary at this point.

When I am ready to operate, I repeat the sequence only this time I tune
the BC-610 and its link coupling for a reading of 400 watts into the dummy

load
of the ME-165, with the ME-165 set to the power position.

Unkey the BC-610, set the ME-165 to OPERATE, key the BC-610
you are on the air with 400 +- watts of RF going out and a very minimum
coming back.

Of course this assumes that the equipment has been tested for accuracy,
and the BC-610 work properly into JUST a 50 ohm load directly, and
that there are no "Gothcas" in your procedure.

"Spares" don't come up often for the T-368!

They are where you find them.

Joe

Howdy all

New to the list and a new owner of a B&W T368C.

As I am getting everything ready to go on the

air, one question is where to get spares -

especially the type 6000 tube. Fair Radio or ....?

Any info on that would be appreciated.

Tnx es 73

hello bob, well, the rf601 and the antenna are up at my house where the shack is. the ho17 and truck are down at the yard where the military vehicles are kept.
i cut a slot in the transparent sheeting in the side nearest to where the radio truck is for the 450 ohm feeder. it seems to work well. the tank shed has electricity annd is warm and dry.
as a matter of interest, the antenna up at the house must be very efficient, as i worked across the pond on 1 watt using a british army w/s 21 on 21 megs.
i suppose it shouldnt work, but one lleg of the doublet goes to the rf 601 via a 150 pf vacuum capacitor, and the other goes to the case which is grounded. cheers, alan

How do you get the feeders out of the HO-17? Or is the RF601 external to the Shelter?

Also, you gave me the serial number earlier but instead of Order Number you gave BC-610-E, which I already knew.

Jim, This is exactly what I do except the antenna is a dipole or doublet, fed with 600 ohm feeder, the Matchbox will tune that to 1.0:1. I use the RY4 terminals from the modulator deck to run the relay in the Matchbox and get 275w 200mA on the plate dipped (not 400w) at 3.615MHZ out into the antenna, maybe my system has losses or the 250TH is not so good or the wattmeter reading is not so accurate but the signal is certainly effective. This is one of the most fun transmitters I have ever used and it took me near on 30 years to find a nice one and then I had to drive 5000+ miles to get it! I have the complete SCR-499 made by Hallicrafters. 73 Max M0GHQ

Subject: Re: [T-368_BC-610] Re:fault LONG

Ah,
Point of fact the RF-601 feeds either a single end-fed wire, or a whip.
It will load up a 32 gallon garbage can from 1.5 to 30 Mhz! Single wire to antenna, ground to a ground stake. Ask me how I know!

These descriptions of the antenna system(s) is getting very strange.
I use the following setup for transmit.
BC-610 to B&W 6 position coax switch. Common on the B&W switch goes VIA 50 ohm coax to ME-165 input, ME-165 output goes via 50 ohm coax to the input of a Johnson KW matchbox thru the SWR detector(directional coupler), the output from the matchbox goes to a single wire which runs for 153 feet (Long-wire) antenna and a 4 foot piece of #4 stranded to an 8 ft. ground rod.

When I the BC-610 on a different band necessitating retuning of the SYSTEM I first put the BC-610 in standby. Then set the ME-165 to the power position.
BC-610 goes to transmit in the tune position. Dip the plate current on the PA
Tube.

There is effectively a 400 watt 50 ohm dummy load at the antenna port of the BC-610. I switch to standby at the BC-610, and change the ME-165 to the adjust position and set the pot (ADJUST) for full scale on the meter of the ME-165.

I change the ME-165 switch to the SWR position, key the BC-610 and adjust the input and output caps on the KW matchbox for minimum on the ME-165 meter.

At this point I have minimized the reflected power coming back from the antenna

through to the ME-165 Trust me it is low!

Put the BC-610 in standby, switch the ME-165 to operate, which places the RF path directly to the matchbox, the BC-610 is now transmitting into the antenna
as its load device. At the matchbox I "Check" the FWD/REF with the switch on the matchbox. to make sure things are OK. With the BC-610 keyed and going to the matchbox I should still see a low reflected reading this time from
the matchbox and its' associated controls, little if any adjustment should be
necessary at this point.

When I am ready to operate, I repeat the sequence only this time I tune the BC-610 and its link coupling for a reading of 400 watts into the dummy load
of the ME-165, with the ME-165 set to the power position.

Unkey the BC-610, set the ME-165 to OPERATE, key the BC-610
you are on the air with 400 +- watts of RF going out and a very minimum coming back.

Of course this assumes that the equipment has been tested for accuracy, and the BC-610 work properly into JUST a 50 ohm load directly, and that there are no "Gothcas" in your procedure.

hello jim,well your set up certainly seems the goods.the rf 601 ia a brilliant device, i picked mine up brand new in the original packing case. it was supposed to go to a saudi arabian embassy, but they cancelled the order. it was sold as scrap ! the rf 625 long wire adaptor m which i would love to get hold of, consists of a jennings 150 pf vacuum capacitor in a case. i made up something similar. the main part of my shack antenna is an old ship's inverted "L" of 97 feet long. the other section is fairly ordinary wire. the
output of the 601 goes via a short connector the the capaciitor box, and thence to the 600 ohm feeder and to the antenna. i found the 600 ohm stuff gave better matching and a lower noise level than the 450. the 601 will match any frequency from 2 to 30 megs into it with less than 2:1 vswr. i originally put it up for my drake TR 4310, but i sold that and now it is for the collins 618T and my main rig the british army w/s 53.
this was our replacement for the bc 610, and uses a pair of 813s in the final.
cheers, alan

Alan,

Now I "see" where you are getting the numbers a "bit" confused.

A doublet, (dipole) is indeed about 73 ohms at the FEEDPOINT in the
middle where you connect the coaxial cable.

However, that does NOT translate to 75 ohms at the transmitter end of
the coaxial cable.

The only thing that happens, is that there IS a "slight" impedance bump
AT the feedpoint.

I have an antenna analyzer here. I feed my dipoles/doublets with with
RG-213 or Belden RG-8. When I put the analyzer on the coaxial connector
in the shack, I read flat 1:1 with it showing 50 Ohms.

It can be a "bit" confusing, however that is how dipoles/doublets have
ALWAYS worked from MY experience of almost 30 years in this hobby.

Max,
My rig (BC-610(I)) has the separate 115 VAC input to just the HV tranny primary coming in through a 20 amp. Variac (metered). That line goes directly to the house "service panel". No sag.

My plate voltage is 2200 VDC at 200 MA. Tubes in the unit are "fairly" fresh!
Sounds like your 250TH may be getting soft. Do you have AC input sag to your setup when in transmit?

Jim, I have a 4kva variac running the whole shooting match, the voltage is 114.7v stby and 108.2v in transmit so 6.5 volts sag, probably a few watts but I would not have thought 125w hihi, the plate current is 190mA and the grid is 65mA, I do not know what the plate volts are, I must measure them sometime just for reference. The 250TH was NOS but that does not really mean anything with a 65 year old final. maybe I will try another but it does mean re neutralising etc, it works fine so I tend to leave alone. Maybe it is just the frequency, some of my other BA's (ART-13 and BC-375/191 etc) are just like this some freq's high o/p and others lower. 73 Max M0GHQ

Ola Max,
What model is the "Beastie" that you are using, per this conversation?

I ask as the "E" model I have do NOT have the connections on a terminal strip,
to allow for the separate feeding of AC to just the HV transformer. I suppose
it could be done, (wouldn't be pretty)!

My "E" model, is used for FSK mostly wit the O39 exciter, that system is on
a separate autotransformer/variac I have that one at 110 volts AC, and don't
see much change in levels when running FSK on the system, and going from
transmit to receive.

As for the difference you are experiencing, when the AC input comes from a
single source, if it sags you lose drive from the rest of the RF system. It might
help to tune the rig to frequency, at that level, and then recheck the driver
stage tuning to get that back to as high as components allow consistant with
good operating practice.

Jim, My one is an E model serial 4427 made by Hallicrafters, I cannot find a contract number anywhere unless it is on the diagram on the rear cover which is not easily got to at the moment. I suppose one could connect directly to the HT transformer and pull the cabling out through the rear of the transmitter, however I personally don't think that is worth it. it complicates the switching and I like to keep it as original as possible. I will try to tune the driver up a bit more and see what happens. Maybe we ought to see if we can qso sometime on AM, I have done 'Stateside earlier in the year with the ART-13, around 04:00z, there is a regular net on 3705 at around that time from Europe, stations from the UK, France Holland and Malta regularly meet here. There are only 3 BC-610 here in the UK working that I know of, Alan, Roger and myself, all E models. I have two other 610E's in bits at the moment serials 990 and 4418. 73 Max M0GHQ

Ola Max,
What model is the "Beastie" that you are using, per this conversation?

I ask as the "E" model I have do NOT have the connections on a terminal
strip,
to allow for the separate feeding of AC to just the HV transformer. I
suppose
it could be done, (wouldn't be pretty)!

My "E" model, is used for FSK mostly wit the O39 exciter, that system is on
a separate autotransformer/variac I have that one at 110 volts AC, and don't
see much change in levels when running FSK on the system, and going from
transmit to receive.

As for the difference you are experiencing, when the AC input comes from a
single source, if it sags you lose drive from the rest of the RF system. It
might
help to tune the rig to frequency, at that level, and then recheck the
driver
stage tuning to get that back to as high as components allow consistant with
good operating practice.

hello bob and everyone. well !!! i have fixed the fault and it was so simple.i kick myself for not thinking of it before. the lower tag on ry 4 was bent so that it touched ground.it must have almost made contact before, and when i fiddled around putting the connection for the matchbox relay on with an extra nut i must have bent it just enough . as you can imagine, you cant see much with the tx in place in the shelter. when i thought of it, i put a meter on the tags and it was obvious. so thanks everyone who gave all those helpful suggestions.
and bob. if you do have those brackets, i can send you the later ones which do not fit, they might come in useful to someone.
i am afraid there is no order number on my tx, it only says hallicrafters , illinois.
i feel really happy this evening ! cheers, alan

How do you get the feeders out of the HO-17? Or is the RF601 external to the
Shelter?

Also, you gave me the serial number earlier but instead of Order Number you
gave BC-610-E, which I already knew.

This is where being a packrat comes in handy. Hone your skills, drag stuff home, squirrel it away for the 'what if/someday I'll need this' eventuality.

I was given a compete RF drawer (with large vac. variable broken), a box of MARS spares, and precious few 6000 tubes a few years back, which I'm guarding jealously until I have time to go through my transmitter, get it working properly, and assess future needs.

As Joe says, they're where you find 'em. If you plan to use and maintain a T-368 going forward, start hitting 'fests and asking friends. A good place to start is with old MARS members. Also under tables at hamfests and flea markets. The shiny stuff is on the tables, the good stuff is in the boxes beneath.

Alan,

I knew it HAD to be something "simple". You kept re-iterating the top removal for coating. I *KNEW* that taking the top off and putting it back on was a "red herring" so to speak. It was the First thing on your mind SINCE it was the MOST recent thing done.

That is a normal "human" response! I used to teach, (Instructor), at a College. I taught Computer Science. Whenever the students would compile their code and get an error, I would keep telling them that the problem was NOT with the line of code where the compiler coughed up a hairball! Look at the line ABOVE that one. In other words, with radios, do NOT lock yourself into the VERY last thing you did - OR - remember you did. Most likely it WILL be a step BEFORE then that was a "significant" issue with regard to the REAL problem.

This is why Robert and myself were trying to get you to ISOLATE the real issue on a "planned" step by step trip through things.

Yes, RY-4 can be a REAL pain in the rump! IF it doesn't WORK, you'll pop fuses or breakers REAL fast. In your instance you had leakage current through the circuit, NOT a direct short. By the way, RY-4 has one specific purpose. It is for use in the SCR-399 shelter package to short the output of the BC-610 so that during receive, the PA loading cap and coil do NOT bother the receiver tuning. I "just" learned that one myself.

Having a stand-alone BC-610, that relay "just" didn't make sense to me. Now I understand.

Congratulations! Now you are back into the fray!

oh thanks a lot bob. you were quite right. i was just working it, but there was no one on frequency. now i have to delve into the bc 342 to find out why it was smoking. at first glance all seems ok. i am sure the scr 399 will keep me busy till i fall off my perch !
i had trouble with the ry 4 when i first got the set, and it was probably me who bent the tag. it was not working, and there was a lot of noise on the 342. it was a loose connection on the relay which i had disturbed whilst cleaning out the dust and spiders.
anyway, the matchbox relay is working now, so the bc 342 antenna input is hooked up to it.

Jim, I have a 4kva variac running the whole shooting match, the voltage is 114.7v stby and 108.2v in transmit so 6.5 volts sag, probably a few watts but I would not have thought 125w hihi, the plate current is 190mA and the grid is 65mA, I do not know what the plate volts are, I must measure them sometime just for reference. The 250TH was NOS but that does not really mean anything with a 65 year old final. maybe I will try another but it does mean re neutralising etc, it works fine so I tend to leave alone. Maybe it is just the frequency, some of my other BA's (ART-13 and BC-375/191 etc) are just like this some freq's high o/p and others lower. 73 Max M0GHQ

Max,

My rig (BC-610(I)) has the separate 115 VAC input to just the HV tranny

primary coming in through a 20 amp. Variac (metered). That line goes

directly to the house "service panel". No sag.

My plate voltage is 2200 VDC at 200 MA. Tubes in the unit are "fairly"

fresh!

Sounds like your 250TH may be getting soft. Do you have AC input sag to your

setup when in transmit?

Jim

Hello All...

Sounds like something out of "On the Beach", the 1950ies thriller
about the aftermath of nuclear war...
A US sub goes all the way to home to california from australia refuge,
tracking an errant, random cw signal.
turns out its a coke bottle tangled in a blind cord...the wind is
pushing it back and forth against a cw key...
and that fine old boat anchor transmitter is smokin...

73...bc-610I serial 44, order number 3357-Phila-52

# 3287. Serial numbers and contract dates

Yahoo group: T-368_BC-610
Date: 2008-06-20 09:09:42 UTC
From: M0GHQ
Topic: 3287  Message: 3287

I notice that a lot of you know the contract dates, however on all of my BC-610E models there does not appear to be any contract date at all, just the serial number and the makers name. Is there a contract date to be found elsewhere or can it be worked out from the serial number. my ones are 990, 4418 and 4427, made by Hallicrafters, they appear to be 1943 and 1944 respectively, the two later ones came from the same source and were used in Italy, I have dated them by the associated equipment I got with them so that is no real indication that the dates are correct. Any ideas? 73 Max M0GHQ

Jim, I have a 4kva variac running the whole shooting match, the voltage is 114.7v stby and 108.2v in transmit so 6.5 volts sag, probably a few watts but I would not have thought 125w hihi, the plate current is 190mA and the grid is 65mA, I do not know what the plate volts are, I must measure them sometime just for reference. The 250TH was NOS but that does not really mean anything with a 65 year old final. maybe I will try another but it does mean re neutralising etc, it works fine so I tend to leave alone. Maybe it is just the frequency, some of my other BA's (ART-13 and BC-375/191 etc) are just like this some freq's high o/p and others lower. 73 Max M0GHQ

Max,

My rig (BC-610(I)) has the separate 115 VAC input to just the HV tranny

primary coming in through a 20 amp. Variac (metered). That line goes

directly to the house "service panel". No sag.

My plate voltage is 2200 VDC at 200 MA. Tubes in the unit are "fairly"

fresh!

Sounds like your 250TH may be getting soft. Do you have AC input sag to your

setup when in transmit?

Jim

Alan,

I did. Problem is time. I may get to taking a look next Wednesday. I think I had a pair of interlock switches and brackets off of a much modified -E that I scrapped 20+ years ago but first I have to find them and then make sure they are the same as what's on the -E I have.

On the plug you are looking for, I'm drawing a mental blank as to what it looks like and where in the transmitter it is mounted. Maybe a look inside the -E in Storage may answer that as well.

This manual also calls for the use of the doublet antenna and concomitantly specifies the use of the variable link PA coils. Accordingly, the use of a 73 ohm dummy load would be appropriate the power output of the transmitter would be controlled by the angular position of the link.

>
> Yet, the ME-165 manual states that it is a 50/51 ohm 600W non-inductive
> dummy load, TM 11-6625-333- du
>
Yes, and the BC-610 using the variable link coils can be adjusted to provide rated power out to this 50 ohm load too as you have discovered. The position of the link would be different, of course, than with a 73 ohm load. In fact, the variable link arrangement is capable of accommodating a WIDE range of load impedances.

>
> My TM 11-826, in the SAME paragraph number says something ENTIRELY

>
> So whom knows?
>
Don't know the date on your manual, but my TM 11-826 dated October 1952 specifies the same dummy load arrangement BUT ALSO SPECIFIES THE USE OF FIXED LINK COILS when making PA power output tests. In this arrangement PA loading would be controlled by means of the 50 uuf VARIABLE capacitor. Check the associated Table XV in your manual.

>
> I know without question that MY -I and my T-213 want and love 50 ohms.
>

Would probably be equally happy with 40, 73 or even 100 ohms, but the variable link positions would be different for each.

Dennis,

The fixed link coils were the EARLY coils. Such as those shipped with E models.

The variable link coils are the LATER coils. Such as those shipped with the SCR-399 using "H", "I", and the T-213. My T-213 was converted by depot from a BC-610 to its current designation in 1959. The porcelain insulators for output are no longer in existence. It shipped with ALL variable link coils right from depot.

A dipole exhibiting 50 ohms at its connector, (point of attachment to radio), will indeed be approximately 73 ohms at the point where the coax feeds the legs. At least that is what we all learned LONG time ago when we got licensed. Current antenna analyzers show this without having to play with formulas.

The only "funny" thing about EITHER the BC-610 or T-213 is its characteristic DISLIKE for an Alpha-Delta multi-band dipole that uses an inductor to "act" as a trap to separate 40mtrs from 80mtrs. It will NOT properly load into either band. Remove the inductor and the remaining wire for 80mtrs and it will happily load all day long into the 40 mtr segment. I suspect that a TRUE trap composed of capacitance AND inductance would work just fine.

I took issue with the "simplistic" view that a BC-610 IS a one single impedance transmitter. Where is ANY adjustable PA output Tx a "single" impedance?

They are NOT. That is WHY they are adjustable. I was also "told" the ME-165 was NOT for use with BC-610s - BUT was meant for T-368s! Hooey!

hello bob, you are quite correct. i found my bc 610 matched a doublet cut for 80. it did 40 and 20 as well on the same antenna. that was using the cord 1290 which is 50 feet of coax. with a dipole centre piece at one end.
it would not do this using twin feeder, or any other coax. i now have a johnson kilowatt matchbox, which is great, and of course i can use the same antenna for receiving. cheers, alan g4gen

HI Guys
F>Y>I
Way back when...we in depot mtce were instructed to check he following:

MFR
Model #
Serial #
Date of mfr
Addendums
Service bullitens
Modification status
Field revisions

Then access the T O appropriate to this unit...IF..infact the tech data storage holder on the unit did  not have an active copy onboard.

Next to perform a visual inspection looking for any (Field Mods) not specifically authorized or approved. {many times local command found reason to make "unauthorized modifications" as their particular needs dictated.

As one Tech Sgt tol me. "Our job is to make the "damn" thing do what the old man wants !

This adds up to finding a MULTITUDE of of variations, all over the world today.

This was perhaps one of the best pieces of iron we ever had to work with.

Today it is still a classic.

Bob,

I agree wholeheartedly! It IS better than a Timex! They just keep
going and going.

I believe some folks get all caught up in the "mobile" setup as
originally intended. If you are going to play with the whip or Uncle's
"long wire", then the BC-939 is the ONLY way to fly.

As to "field modifications", the only ones I've seen have been done by
Amateur Operators. I saw one where "someone" decided to put an aluminum
plate between the oscillator section and the PA section. I know that
this was NEVER done by Uncle. It does NOT need it.

Simple philosophy - Don't fix what ain't broke!

Another one: Don't take it apart to see WHY it works!

Plate current is 7 megamps. Plate voltage is 5 microvolts.

I finally figured out what it was in my signature block that Yahoo was blocking. It was the URL to my store. Which is dumb as every email sent out from the list here has a tail of five of them. But anyway so was sbcglobal and I now suspect some others where I've answered people repeatedly and either never heard from them again or they repeated the question they asked.

BTW, I posted an inquiry to several lists last week and I don't recall whether in the one to this list I remembered to delete the signature. So I'll repeat it. Does anyone have a loose TN-339 cover or a junker they would sell the cover off of? A friend on the Left Coast has TN-339 S/N 1, sans cover.

and, that was in the subject line of the T-339 cover.

I would remind everyone that -most- of these email lists (as well as I)
prefer and some insist, that you send -plain text only- messages (no
html, no special formatting, or special fonts, etc...) otherwise, the
message will -not- go through.

# 3304. Microphonics, hum, and carrier

Yahoo group: T-368_BC-610
Date: 2008-07-10 21:29:33 UTC
From: mike Kana
Topic: 3304  Message: 3304

Hi all

I have been in consultation off list on this
but wanted to throw this out to the group as
well - I have been offline testing my T3
until I get the external L strung - when listening
in tune and op on an external HF RX, I hear
a bit of hum on the carrier.

One suggestion was possible microphonics and
that fan does do some vibrating - not sure
how to handle that short of building a stand alone
blower and feed into the cabinet.

Any other folks run into this slight hum issue -
obviously I want my audio to sound good and
plan to do the audio mods but if there are
some hints/kinks on sniffing out a slight hum
then that would be great to hear - it its
something intrinsic to the system then ohwell but
I think some poking around is in order.

Recommend getting on the air and see if anyone else can hear it. You may not have a problem.

Tighten the nut that holds the microphone plug onto the front panel, then tighten ALL other grounds throughout the transmitter just to be sure/anal.  That should shunt all stray voltages to ground.  Remove paint, rust, corrosion, mold, slime, etc. as needed.

Oh, yeah, ... clean, clean, clean.

The blower isn't really necessary unless you're going key-down all day long, but you could mount it in rubber if it still roars after replacing the bearings.  A turning vane in the 90 degree fitting will help, too.  Punching the hole in the back panel out to it's max diameter will help, too.

Alan,

I'm glad that you located it. I haven't gotten around to looking yet. Every
week that passes seems to find me a week and a half farther behind.

On the BC-611, the only way to know whether a chassis is working is to fire
it up, test it and if necessary repair it. I simply don't have the time to do
that. If the thing works perfectly, it will take 2 or 3 hours start to
finish. And odds are there will be at least something needing repair, most commonly
the audio output capacitor. Which is another hour. The best I could do on a
bare chassis is make sure there's nothing obviously wrong. If you really
mean a complete radio and not just a chassis, your best bet would be to find one
on eBay that as far as you can tell isn't a basket case, buy it, find out what
parts are missing (there are almost always some as most sellers are clueless,
and fix it. I would try to avoid the BC-611-F because it is not uncommon to
find one or more open coils in the IF transformers. And although I once had a
good stock of replacements, I am about to use my last one.

Be advised:  I get no warning that someone's posting has been dumped into the spam bucket, I have to go check it whenever I get a round toit, and they are hard to come by!!

This one came through fine, what ever you did worked.  There is nothing I can do from this end about posts that go into the spam dumpster.

Now, then!  About that 7 MEGamps of  Plate Current,.....  I think you're bragging, Bob.

Joe,

Maybe I multiplied when I should have divided. You know how slide rules are about that. :-)

Just as a passing comment, it is my considered opinion that spam blockers have surpassed spam as the worst email problem.
